Thank you for purchasing Electronic Total Station N7/N9 Series.

The WIN-CE interface of N7/N9 isvery similar with a Windows-based PC, You can connect them easily and realize real-time data exchanging and processing on both ends.

This manual is applicable to: N7/N9 Series Total Station.

Please read the manual completely before operating the instrument.

#### **PRECAUTIONS**

- 1. Do not collimate the objective lens direct to sunlight without a filter.
- Do not store the instrument in high and low temperature to avoid the sudden or great change of temperature.
- When the instrument is not in use, place it in the case and avoid shock, dust and humidity.
- 4. If the temperature varies greatly between work site and the instrument depository, do not set to work as soon as arrived; leave the instrument in the case for a while till it adapted environment temperature.
- When storing the instrument long time without use, disconnect the battery from the device. The battery should be charged once a month.
- Please give special attention to the packing Shock absorption is very important in long distance transportation.
- For less vibration and better accuracy, the instrument should be set up on a wooden tripod rather than aluminum tripod.
- 8. Clean exposed optical parts with degreased cotton or lens tissue only.
- If the instrument gets wet in the rain, do not try to power it on at once, clean the surface with a soft cloth and then keep the instrument in a well-ventilated place.
- 10. Before set up the job, check initial settings of the instrument as well as the parameters.
- Unless the user is a maintenance specialist, do not attempt to disassemble the instrument by oneself.
- When the laser is switched on, do not look into the objective Len with naked eye.

#### BATTERY NOTIFICATION

 Battery should be recharged only with the charger LC-01 which comes with the total station.

#### 2. Battery Recharging Cautions:

The charger has built-in circuitry for protection from overcharging. However, do not leave the charger plugged into the power outlet after recharging is completed. Be sure to recharge the battery at a temperature of 0°~±45°C, recharging may be abnormal beyond the specified temperature range. Prohibit the use of any charger or battery that has been damaged.

#### 3. Battery Storage Cautions:

Rechargeable battery can be repeatedly recharged 300 to 500 times. Long time totally discharge of a battery may shorten its life. The battery should be recharged at least one time a month, which will help increase its full charge capacity. Do not keep the battery at high heat and damp places. Do not short-circuit the battery. Dispose of batteries properly. Do not throw them into fire or expose to high temperature.

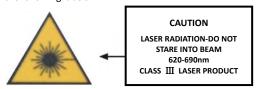

## **SAFETY GUIDE**

For laser EDM (visible laser)

#### Warning:

The total station is equipped with an EDM of a laser grade---3R/IIIa. It is verified by the following labels.

Over the vertical tangent screw sticks an indication label "CLASS III LASER PRODUCT".

A similar label is pasted on the opposite side.

This product is classified as Class 3R laser product, which accords to the following standards.

IEC60825-1:2001 "SAFETY OF LASER PRODUCTS".

Class 3R/III a laser product: It is harmful to observe laser beam continuously. User should avoid sighting the laser at the eyes. It can reach 5 times the emitting limit of Class2/II with a wavelength of 400mm-700mm.

## Warning:

Continuously looking straight at the laser beam is harmful.

#### Prevention:

Do not stare at the laser beam, or point the laser beam to others' eyes. Reflected laser beam is a valid measurement to the instrument.

## Warning:

When the laser beam emits on prism, mirror, metal surface, window, etc., it is dangerous to look straight at the reflex.

#### Prevention:

Do not stare at the object which reflects the laser beam. When the laser is switched on (under EDM mode), do not look at it on the optical path or near the prism. It is only allowed to observe the prism with the telescope of total station.

Warning: Improper operation on laser instrument of Class 3R will bring dangers.

## 1. NOMENCLATURE AND FUNCTIONS

## **1.1 NOMENCLATURE**

## 1.2 KEYPAD

## Functions of the Keys

Key	Nomenclature	Function		
Φ	Power Key	To switch power ON/OFF.		
0~9	Numeric Key	To input desired numbers.		
A~/	Alpha Key	To input alphabets.		
•	Inputting Panel Key	To display inputting panel.		
B.S	Backspace	To delete one character leftward when		
		inputting numbers or alphabets.		
4	Cursor Key	To move the cursor up/down/left/right.		
α	Alpha Shifting Key	To shift to alphabet inputting mode.		

*	Star Key	To launch several common functions	
ESC	ESC Key	Quit to previous screen or previous mode.	
ENT	Enter Key	To finish and accept the data input.	
SP	Space Key	To Input space	
ALT	Alt Key	Same function on PC	
TAB	Tab key	To move cursor rightward or to next character	
		field	

#### 2. SYNCHRONIZATION WITH PC

#### 2.1 The Installation of Microsoft Windows Mobile Device Center.

There is a CD attached with the instrument. Put it into your CD-ROMand install Windows Mobile, then you can establish Windows Mobile connection between N7/N9 and Computer.

#### **Before Installing Windows Mobile Device Center**

Before installing, read the following words carefully:

- During the installation processing, reboot your computer is required. Therefore, please save your jobs and quit all the applications before installation.
- •To install Windows Mobile Device Center, you are supposed to have an USB cable (available in the product package) connect the TS with PC.

## **Installing Windows Mobile Device Center**

• put the CD in the drive.

Windows Mobile Device Center Installation Guide will be run automatically.

Click "Next" to install Windows Mobile Device Center.

#### 2.2 CONNECTING TOTAL STATION WITH PC

- Connect the N7N9 and computer with the USB cable.
- Power the total station on. The software will detect the Total station and setup the communication. When connection established successfully, the following message will display.

## Using "Browse" Function

After the synchronization, you can click "Browse" button to view the files stored in the total station.Copy, paste and deletion are synchronized on both ends. See the picture below.

## 3. KNOWING ABOUT YOUR N7/N9

Press POWER to turn on the instrument. See the initial interface as below.

#### 3.1 OPERATING SYSTEM

N7/N9 is based on Windows CE operating system; WINCE is quite similar to Windows system. The functions and interfaces are easy to use for the surveyor.

Note: we also offer powerful mapping softwarein N7/N9. WinMG (Mapping Genius) and WinEG (Engineering Genius). They can help you to finish most of the office work soon after field measuring.

#### 3.2 SETTING YOUR TOTAL STATION

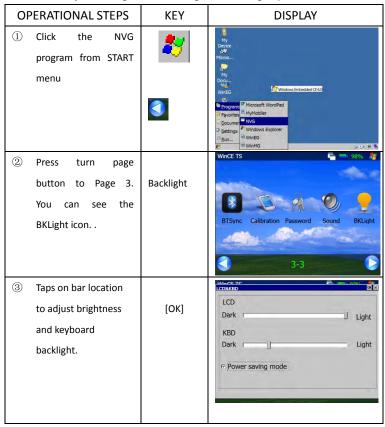

You can adjust the default settings of N7/N9 according to the following steps.

## 3.2.1 Backlight adjustment

The system will automatically shut the backlight when battery is running low.

You can also adjust the brightness of backlight as following steps.

There is option to open Power Saving mode or not, if you click it, the screen will light on one side which you operate, and the other side will be off to save battery energy.

## 3.2.2 Touch-screen Adjustment

If your device is not responding accurately to screen taps, Adjust the touch screen by the following steps.

0	PERATION STEPS	KEY	DISPLAY
1	Click the NVG program from START menu	<b>₹</b>	Ny Device  North Control of March Contro
2	Press turn page button to Page 1. You can see the Calibration icon	Calibration	WinCETS S416 F  BTSync Calibration Password Sound BKLight
3	Click "Calibration", and then "Recalibrate".	Calibration + Recalibrate	WinCE IS  Double-Tap Calibration  If your device isn't reponding properly to your taps, you may need to recalibrate you screen.  To start the recalibration process, tap Recalibrate  Recalibrate  Recalibrate  BKLight

_	COM		
4	According to the		Carefully press and briefly look stylus on the sense of the stages.
	prompt, usethe		Regist As the target recives around this streen. Press the fact key to cancel.

	cross center. Repeat		
	as the cross moves		
	around the screen.		
	Totally adjust 5		
	points as guide.		
(5)	Press [ENT] to save	[ENT]	New calibration settings have been measured. Press the Enter key to accept the new settings.
	new setting,	+	Press the Esc key to keep the old settings.
Pres	ss [Esc] to return to	[Esc]	
con	trol panel.		

#### 3.3 APPROACHES TO INPUT NUMBER AND CHARACTER

For Total Station N7/N9, two kinds of inputting approaches are available. One is using the keyboard, like the keyboard of a mobile phone, with 3 characters on one key. Press it once to display the first characters. Press it twice to display the second one. And press it three times to display the third character. The other way is using soft keyboard. Press icon [ ] to enter inputting interface. As an example, here we create a folder named "Job-1".

## [Example 1: Inputting by soft keyboard]

[Liample 1: imputting i		
OPERATION STEPS	KEY	DISPLAY

current working project.		Standard Measurement Program		
Press [ left] key to close soft keyboard.				

## [Example 2: Input by physical keyboard]

C	PERATIONAL STEPS	KEY	DISPLAY
1	Click "project" and choose "New project" on the pull-down menu.		Project Informa Projectid Project D
2	Switch to character input mode by press [@]. Then press [4] one time to input a capital letter "J'.	[@] [4]	New Project   X   X
3	Press [5] twice quickly to input letter "o", [7] twice quickly to input "b".	[5] [5] [7] [7]	Project Informa Projectid Meas Dat Coord Da Fixed Dat Occ Pt:1 BS Pt:2 SS Pt: FS Pt:  Create    New Project   X   X

 $\fint \%$  1) press [lacksquare] key one time to open the soft keyboard. Press again to close it.

Or using stylus of to select "Keyboard" on pop-up menu to activate soft keyboard. When soft keyboard is activated, press and select "Hide Input Panel" to close soft keyboard.

※2) Under the status of letter inputting mode, each key has defined 3 letters. Every time pressing will display one letter. Thus pressing once can display the first letter, the same key twice for the second, and three times to display the third letter.

## 4. STAR KEY (★) MODE

Press the  $(\bigstar)$  to view the common settings.

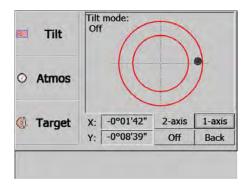

TILT: Electric Circular Vial Graphic Display.

ATMOS: Set the Temperature, Pressure, Atmospheric Correction Value (PPM) and Prism constant value (PSM).

TARGET: to set Target Type, Crosshair light, to check Signal (strength) level.

## 1. Electric circular bubble graphic display

Electric circular bubble can be displayed by graphic. This function will help you leveling the instrument when the circular vial is hided behind the Main body of the instrument.

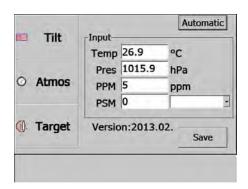

Rotate the leveling screws while observing electric circular bubble. After the bubble centered at the cross point, press [Back] to return the previous interface.

# 2. Set the Temperature ,Pressure, Atmospheric Correction Value (PPM) and Prism constant value (PSM)

Click [Atmos] to view the Temperature, Pressure, PPM and PSM. To modify parameters, point the cursor to the textbox by stylus, and input the new value. Please Refer to "14. SYSTEM SETTINGS" for the detail.

# 3. Set the target type, illumination of crosshair and check the signal intensity.

Click [Target], target type, illumination of cross hair, etc. can be set.

Setting of target type:

There are two measuring modes for N7/N9 series: visible laser EDM and invisible laser EDM. The reflector can be set as Prism, Non-prism and Reflecting Sheet.

Refer to "technical parameters" for the parameter of different reflectors.

Setting of illumination of cross hair:

- Move the stylus to adjust the brightness of crosshair.
- L: Indicate that the crosshair is dim.
- H: Indicate that the crosshair is bright

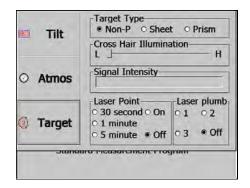

Move the stylus from left to right to change the brightness of the crosshair from dim to bright.

#### Setting of signal mode:

The reflector return signal intensity was displayed in this mode. It will buzzer when return signal from the prism was received. This function is more convenient for collimation when the target is difficult to find.

The received return signal level is displayed with bar graph as follows.

No light acceptance Minimum quantity level Maximum quantity level

4. **Setting of Laser Pointer and Laser Plumb:**change the on/off and working time of Laser pointer; set the on/off and intensity of the laser plumb

## 5. PREPARATION FOR MEASUREMENT

#### 5.1 UNPACKING AND STORAGE OF INSTRUMENT

- Unpacking of instrument

Keep the case right side up with care, and open the instrument container and take out the instrument.

- Storage of instrument

Cover the objective lens with the cap and place the instrument

into the case. Make sure the vertical clamp screw and circular vial stay upwards (Objective lens towards tribrach), and slightly tighten the vertical clamp screw and lock the case.

#### **5.2 INSTRUMENT SETUP**

Put the instrument on the tripod. Level and center the instrument precisely.

#### Operation Reference:

- 1. Leveling and Centering the Instrument by plumb bob
- 1) Set up the tripod
- ① Adjust the tripod legs to suitable length, make the tripod head parallel to the ground and tighten the screws.
- ② Make the centre of the tripod and the occupied point approximately on the same plumb line.
- ③ Set the tripod and make sure it is well stationed on the ground.
- 2) Put the instrument on the tripod

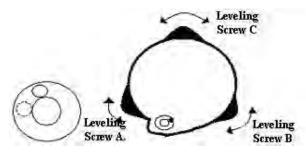

Put the instrument carefully on the tripod head and slide the instrument by

loosening the tripod head screw. If the plumb bob is positioned right over the center of the point, slightly tighten the tripod head screw.

3) Roughly leveling the instrument by using the circular vial bubble.

①Turn the leveling screw A and B to move the bubble in the circular vial, in which case the bubble is located on a line perpendicular to a line running through the centers of the two leveling screw being adjusted.

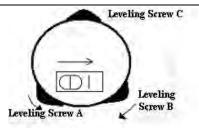

Turn the leveling screw C to move the bubble to the center of the circular vial.

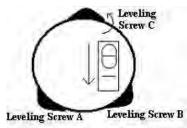

4) Precisely leveling by using the plate vial

①Rotate the instrument horizontally by loosening the Horizontal Clamp Screw and place the plate vial parallel to the line connecting leveling screw A and B, and then bring the bubble to the center of the plate vial by turning the leveling screws A and B.

②Rotate the instrument 90º (100g) around its vertical axis and turn the remaining leveling screw or leveling C to center the bubble once more.

③Repeat the steps ①② for each 90º (100g) rotation of the instrument and check whether the bubble is correctly centered in all directions.

- 2. Centering by using the optical plummet
- 1) Set tripod

Set up tripod to suitable height, ensure equal length of three legs, spread and make tripod head parallel to the ground, and place it right above the measurement station point. Prop up tripod on the ground and fix one leg.

Install instrument and collimate the point
 Set instrument carefully on tripod, tighten the central connecting screw and adjust

optical plummet to make the reticle distinctly. Hold the other two unfixed legs with both hands and adjust position of these two legs through observation of optical plummet. As it approximately aims at the station point, make all three legs fixed on the ground. Adjust three leg screws of the instrument to make optical plummet collimate precisely to the station point.

3) Use circular vial to roughly level the instrument.

Adjust length of three legs of tripod; make the circular vial bubble of the instrument in the middle.

- 4) Use plate vial to level the instrument accurately.
- ①Rotate the instrument horizontally by loosening the

Horizontal Clamp Screw and place the plate vial parallel to the line connecting leveling screw A and B, and then bring the bubble to the center of the plate vial by turning the leveling screws A and B.

- ②Rotate the instrument 90°C, make it perpendicular to the connecting line of level screws A and B. Turn level screw C to make the bubble of the plate vial in the middle.
- 5) Precisely centering and leveling

Through observation of optical plummet, slightly loosen the central connecting screw and move the instrument evenly (Don't rotate the instrument), making the instrument precisely collimating to the station point. Then tighten the central connecting screw and level the instrument precisely again.

Repeat this operation till the instrument collimate precisely to the measurement station point.

#### 5.3 BATTERY INFORMATION

#### Notice:

① The battery operating time will vary depending on the environmental conditions such as ambient temperature, charging time, the number of times of charging and discharging etc. It is recommended for safety to charge the battery beforehand or to prepare spare full charged

#### batteries.

- ② The battery icon shows the power level regarding the current measurement mode. The distance measurement mode consumes more power than angle measurement mode, so the power enough for the latter is not sure applicable for the previous one. Pay attention to this when switching angle measurement mode to distance measurement mode, because insufficient battery power might lead to interrupted operation.
- •Battery status should be well checked before outdoor operation.
- ③ When the measurement mode is changed. The battery power would not immediately show the decrease or increase. The battery power indicating system shows the general status but not the instantaneous change of battery power.

## Battery Recharging Cautions:

☆ Battery should be recharged only with the chargerSD841201 going with the instrument.

Remove the on-board battery from instrument and connect it to battery charger. When the indicator lamp on the battery charger is orange, the recharging process has

begun. When charging is complete (indicator lamp turns green), disconnect the charger from its power source.

·Battery Removal Cautions:

Before removing the battery from the instrument, make sure that the power is turned off. Otherwise, the instrument may be damaged.

·Battery Recharging Cautions:

The charger has built-in circuitry for protection from overcharging. However, do not leave the charger plugged into the power outlet after recharging is completed.

Be sure to recharge the battery at a temperature of  $0^{\circ}$ ~ $\pm 45^{\circ}$ C, recharging may be abnormal beyond the specified temperature range .

When the indicator lamp does not light after connecting the battery and charger, either the battery or the charger may be damaged. Please connect professionals for repairing.

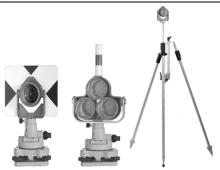

## ·Battery Charging Cautions:

Rechargeable battery can be repeatedly recharged 300 to 500 times. Complete discharge of the battery may shorten its service life. In order to get the maximum service life, Make sure you recharge it at least once a month.

#### 5.4 REFLECTOR PRISM

When measuring the distance, a reflector prism needs to be placed at the target point. Reflector systems come with single prism and triple prisms, which can be mounted with tribrach onto a tripod or mounted onto a prism pole. Reflector systems can be self-configured by users according to job.

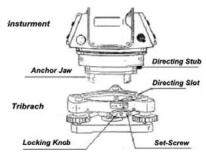

# 5.5 MOUNTING AND DISMOUNTING INSTRUMENT FROM TRIBRACH

·Dismounting

If necessary, the instrument (including reflector prisms with the same tribrach) can be dismounted from tribrach. Loosen

the tribrach locking screw in the locking knob with a screwdriver. Turn the locking knob about 180° counter-clockwise to disengage anchor jaws, and take off the instrument from tribrach.

#### ·Mounting

Insert three anchor jaws into holes in tribrach and line up the directing stub with the directing slot. Turn the locking knob about 180° clockwise and tighten the locking screw with a screwdriver.

#### 5.6 EYEPIECE ADJUSTMENT AND COLLIMATING OBJECT

Method of Collimating Object (for reference)

- ①Sight the Telescope to bright place and rotate the eyepiece tube to make the reticle clear.
- ②Collimate the target point with top of the triangle mark in the coarse collimator. (Keep a certain distance between eye and the coarse collimator).

Make the target image clear with the telescope focusing screw.

☆ if there is parallax when your eye moves up, down or left, right, it means the diopter of eyepiece lens or focus is not well adjusted and accuracy will be influenced, so you should adjust the eyepiece tube carefully to eliminate the parallax.

#### 5.7 VERTICAL AND HORIZONTAL ANGLE TILT CORRECTION

When the tilt sensors are activated, there will be an automatic compensation value added into the vertical and horizontal angles.

Tilt sensor must be turned on; it can help improve the precision. When a dialog of compensation displays, it indicates that the instrument is out of automatic compensation range  $(\pm 3.5)$ , and must be leveled manually.

N7/N9 Series compensates the inclination in both X and Y directions.

OPERATION STEPS	KEY	DISPLAY
If the instrument hasn't been leveling, a compensation dialog box will pop up automatically. As shown in the right graph.	STAR key	Tilt  O Atmos  Tird
Turn the leveling screw to m dot move into the small circl When the small black dot is circle, it means the instrume auto tilt compensation scale  If it is outside the sm instrument needs to be level	e. in the small nt is within the ±3.5'. nall circle, the	Function Help  Tilt mode:  2-axis  Atmos  X: 0°00'02"

- When the instrument is set on an unstable stage especially in a windy day. You may turn off the auto tilt correction function; otherwise it may leads to a wrong value.
- If the tilt sensor turn on already (Single Axis or Dual Axis), you can level the instrument according to the electronic bubble show above.

## 6. BASIC SURVEY

On desktop of N7/N9 click 2 to open the program of basic survey, as shown in the following graph:

Description of each function key:

Function keys display at the bottom of the screen, which change with the measure mode.

The following graph lists each function key in every measure mode.

Mode	Display	Soft	Function		
		key			
0 Set 2		1	0 Set horizontal angle.		
	HSet	2	Preset a horizontal angle.		
∀Angle	Hold	3	Hold horizontal angle.		
<b>▼</b> Arigie	Repeat	4	Repeat horizontal angle measurement.		
	V%	5	Switch vertical angle and percentage.

How to collimate the targets (For reference)

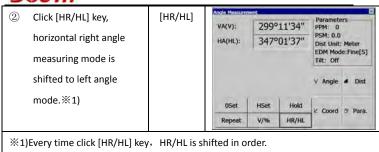

- ① Point the telescope toward the light, rotate the eyepiece ring, focalize the telescope so that the crosshair is clearly observed (turn the eyepiece ring to you first and then to focus) .
- ② Aim the target at the peak of triangle mark of the collimator. Keep a certain space between the collimator and yourself for collimation.
- ③ Focus the target with the focusing knob until the target is clearly seen and its center is right on the crosshair.

If parallax exists between the crosshair and the target when viewing vertically or horizontally through the telescope, focusing is incorrect or diopter adjustment is poor. This adversely affects precision in measurement or survey. So please eliminate the parallax by focusing and using diopter adjustment carefully.

## 6.1.2Switch Horizontal Angle Right/Left

- ※2) To revise wrong value, use stylus or press [▶]/ [◀] moving the cursor to right of the number need to delete. Click [♣] on the panel or press [B.S.] to delete wrong value and input correct one.
- 3) With wrong input value (for example 70 $^{\prime}$ ), Setting failed, press [ENT], the system doesn't respond, input again from step 3.

# 6.1.4Vertical Angle Percentage (%) Mode

Make sure the mode is Angle measurement.

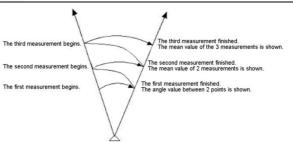

#### Example:

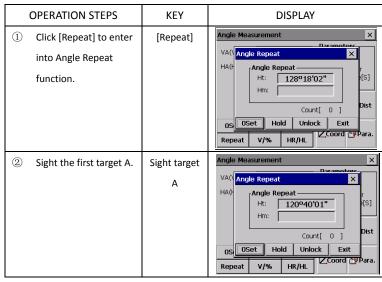

## **6.1.5Angle Repetition Measurement**

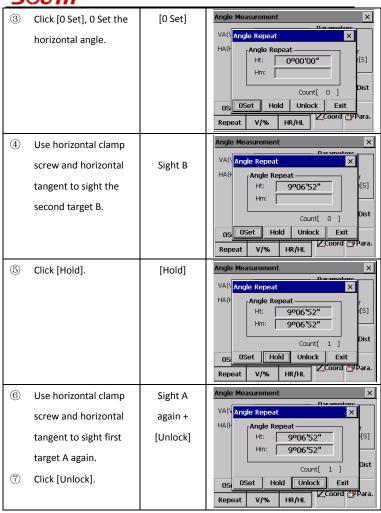

This program is used to angle repetition measurement, displaying the sum and average value of all observed angles. It records the observation times at the same time.

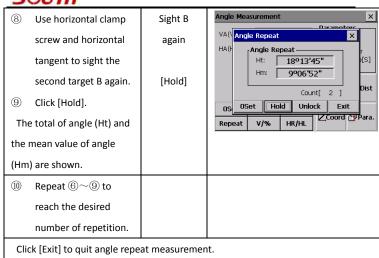

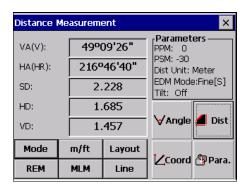

## **6.2 DISTANCE MEASUREMENT**

In basic surveying screen, click [Dist] to enter into distance measurement.

#### NOTE:

Do not aim at strongly reflecting targets (such as traffic lights). The measured distances may be wrong or inaccurate.

When the [DIST] is triggered, the EDM measures the object which is in the beam path at that moment.

If e.g. people, cars, animals, swaying branches, etc. cross the laser beam while a measurement is being taken, a fraction of the laser beam is reflected and may lead to incorrect distance values.

Avoid interrupting the measuring beam while taking reflectorless measurements or measurements using reflective foils.

## Reflectorless EDM

- Ensure that the laser beams cannot be reflected by any object nearby with high reflectivity.
- •When a distance measurement is triggered, the EDM measures to the object which is in the beam path at that moment. In case of temporary obstruction (e.g. a passing vehicle, heavy rain, snow, frog, etc.), the EDM may measure to the obstruction.
- When measuring longer distance, any divergence of the red laser beam from the line of sight might lead to less accurate measurements. This is because the laser beam might not be reflected from the point at which the crosshairs are pointing. Therefore, it is recommended to verify that the R-laser is well collimated with the telescope line of sight.
- Do not collimate the same target with the 2 total stations simultaneously.
- Accurate measurements to prisms should be made with the standard program (infrared mode).
- Red Laser Distance Measurement Cooperated with Reflective Foils.

The visible red laser beam can also be used to measure to reflective foils. To guarantee the accuracy the red laser beam must be perpendicular to the reflector foil and it must be well adjusted

Make sure the additive constant belongs to the selected target (reflector).

#### 6.2.1 Setting Atmosphere Correction

• Distance measurement is influenced directly by the atmospheric conditions of the air in which distance measurement are taken.

In order to take into consideration these influences distance measurements are corrected by using atmospheric correction parameters.

Temperature: Air temperature at instrument location.

Pressure: Air pressure at instrument location.

Atmos PPM: Calculated and indicated atmospheric PPM.

# 6.2.1.1 Calculation of Atmospheric Correction

● The value of Atmospheric Correction can be influenced by air pressure, air temperature and the height. The calculating formula is as follows: (calculating unit: meter)

If the pressure unit adopted is mmHg: make conversion with:

1hPa = 0.75mmHg.

● The standard atmospheric condition of N7/N9 Series

(e.g. the atmospheric condition under which the atmospheric correction value of the instrument is zero ):

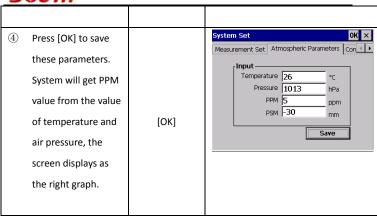

Pressure: 1013 hPa Temperature:  $20^{\circ}$ C

If regardless of atmospheric correction, please set PPM value as 0.

C	PERATION STEPS	OPERATION	DISPLAY

Atmospheric Correction value also can be set in star key (★)mode.

## **6.2.2** Atmospheric Refraction and Earth Curvature Correction

When calculating the horizontal distance and the height differences, the instrument will automatically correct the effect of atmosphere refraction and the earth curvature the correction.

The atmosphere refraction and the earth curvature are calculated by the formulas as
follows:
Corrected Horizontal Distance:
D=S * [ $\cos\alpha$ + $\sin\alpha$ * S * $\cos\alpha$ (K-2) / 2Re]
Corrected Height Differentia:
$H=S*[\sin\alpha+\cos\alpha*S*\cos\alpha(1-K)/2Re]$
If the correction of atmosphere refraction and the earth curvature are neglected
the calculation formula of horizontal distance and the height differentia are:
D=S·cosα
H=S·sinα
In formula: K=0.14 Atmosphere Refraction Modulus
Re=6370 km The Earth Curvature Radius
$\alpha(\text{or}\beta)$ The Vertical Angle Calculated From Horizontal Plane (Vertical Angle)

S Oblique Distance

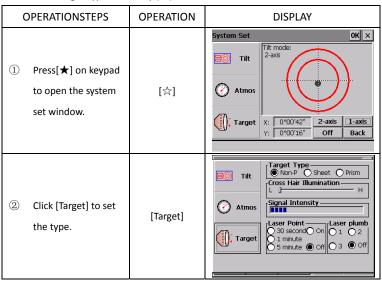

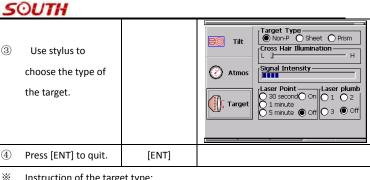

**NOTE:** The atmosphere refraction modulus of this instrument has been set as: K=0.14.it also can be set as: K=0.2,or be set shut (0 VALUE).(refer to "14"SYSTEM SETTINGS).

## 6.2.3 Setting Target Type

N7/N9 Series Total Stations can set options of visible Laser EDM and Invisible Laser EDM, as well as reflector with prism, non-prism, and reflective sheet. User can set them according to the requirements of the job.

You can set Target Type in star key (★)model.

Instruction of the target type:

Mon-P: measure with the visible red laser, no need to use prism. All of types of target are available for measure.

Sheet: Use the sheet as target to measure. Prism: Use the prism as target to measure.

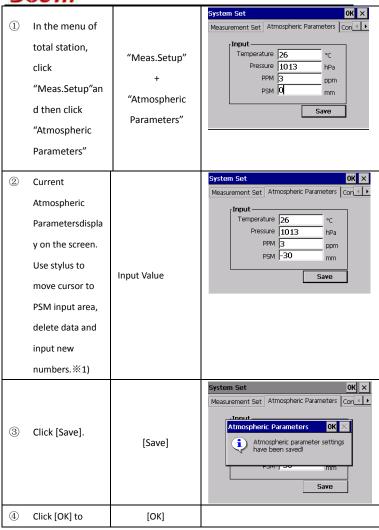

Frism: Use the prism as the target to measure.

## **6.2.4Setting the Prism Constant**

Since the constants of prisms manufactured by different companies are different, the corresponding prism constant must be set. Once the prism constant is set, it would be kept even if the machine is turned off.

OF	PERATIONSTEPS	OPERATION	DISPLAY
----	---------------	-----------	---------

SOUTH

You also can set Prism Constant in star key (★) mode.

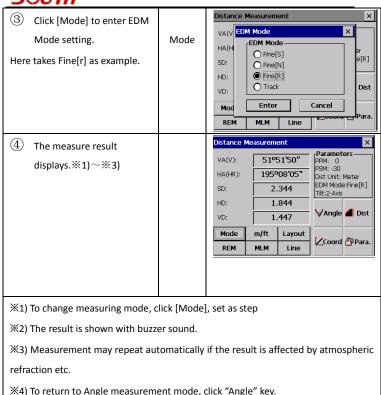

# **6.2.5Distance Measurement (Continuous Measurement)**

Make sure the mode is Angle measurement.

See the Example in next page.

- ※2) Refer to Section "6.1.3 Horizontal Angle Reading Setting" or "6.3.2 Setting the Backsight Point".
- %3)Click[Mode], the mode (SINGLE/N-TIME/REPEAT/TRACKING) changes .
- %4) To return to the normal angle or distance measuring mode, click [Angle]/ [Dist].

# 7. APPLICATION PROGRAMS

#### **7.1 LAYOUT**

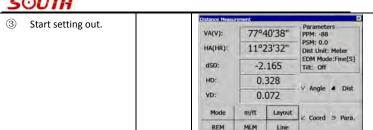

The difference between the measured distance and the preset distance is displayed.

The displayed value = Measured distance – Standard (Preset) distance

•This function enables the stake-out of Horizontal Distance (HD), Vertical Difference (VD) or Slope Distance (SD).

OPERATION STEPS	KEY	DISPLAY
① Under the mode of Distance Measurement, click [Layout].	[Layout]	VA(V): 77°40'29" Parameters PPH: -88 PSH: -0.0  I1°23'39" Dist Unit: Meter SD: SD:
② Select the distance measurement mode (SD/HD/VD) to be laid out. After inputting the data to be laid out, click [Enter] ※ 1)		VA(V): 77°40'38"

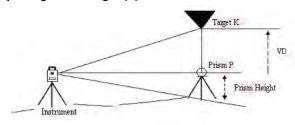

※1)A dialog box prompts to enter slope distance you want to layout, after entering click[Enter] to layout SD. To layout horizontal distance, input 0 in SD dialog box. Click[Enter], the HD box will prompt. After entering click [Enter] to layout HD. To layout height difference, input 0 in SD and HD box, and thenthe dialog box of VD to be staked out will prompt.

## 7.2 REMOTE ELEVATION MEASUREMENT (REM)

The Remote Elevation program calculates the vertical distance (height) of a remote object relatively to a prism and its height from a ground point (without a prism height). When using a prism height, the remote elevation measurement will start from the prism (reference point). If no prism height is used, the measurement will start from any reference point in which the vertical angle is established. In both procedures, the reference point should be perpendicular to the remote object.

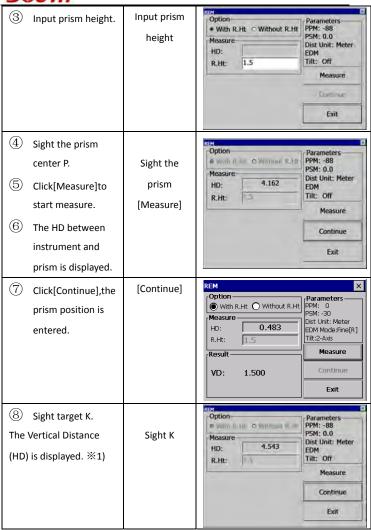

# 7.2.1Inputting Prism Height (h)

Example: (h=1.5m)

OPERATION STEPS	KEY	DISPLAY
In Distance     Measurement,     click[REM]to enter     into REM function.	[REM]	VA(V): 77°40'39"   Parameters   PPM: 88   PPM: 88   PPM: 88   PPM: 88   PPM: 98   PPM: 88   PPM: 98   PP
② As shown in the right graph, usestylus to click "WithR.Ht".	[With R.Ht]	Option  With R.Ht. Without R.Ht Measure HD: R.Ht: 1.8  Parameters PPM: - 98

•The observation procedure of (A-B, B-C) is same as (A-B, A-C).

# 7.4 LINE MEASUREMENT (LINE)

The Line Measurement program allows the user to measure the height of an inaccessible object above a point.Both the inaccessible object and the point are located along an established base line. Two prisms, A and B, are set up apart from each other below the object to establish the base line. The horizontal distance is measured and set in the instrument for both prism A and B. The screen then

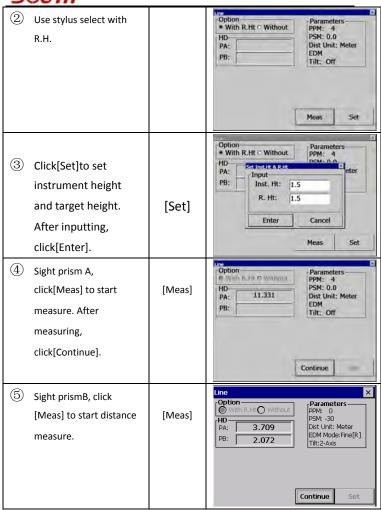

shows the vertical distance from prism A and B, the horizontal distance from the instrument to prism B, and the distance along the base line and the screen will display the vertical distance from prism A to that point, the horizontal distance for that point. Additionally, the vertical distance between two points on the base line, Point G and L in the diagram can be measured.

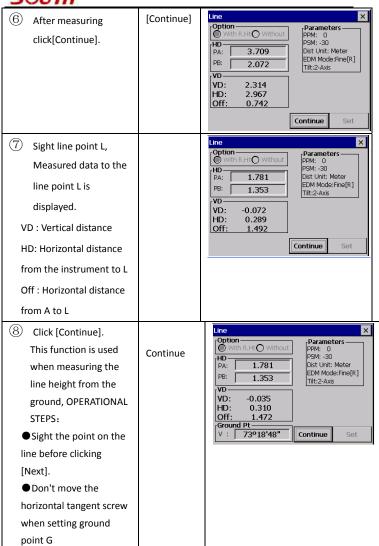

Example: Input of prism height

OPERATION STEPS	KEY			DISPLAY	′

\*\*3) The NEXT key is used when the ground point G is not clear and you would like to check another ground point G on the same vertical line.

## 7.5 TRAVERSE MEASUREMENT (RESTORE NEZ)

In this program the coordinate for the next point is stored in memory after the measurement is completed and accepted. The feature allows the user to occupy the next move-up point and use the previous occupied point for the backsight orientation. When occupying the next point and backsighting the original occupied point, the instrument will display the reverse angle for backsight orientation. If the occupied coordinate is not preset, zero (0,0,0) or the previous preset coordinate will be used for this program.

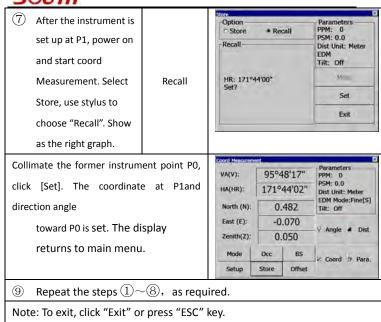

•Set the coordinate value of instrument point P0 and set the direction angle from P0 toward the known point A.

## 7.6 OFFSET MEASUREMENT (OFFSET)

There are four offset measurement modes in the Offset Measurement.

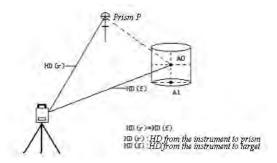

- 1. Angle offset
- 2. Distance offset
- 3. Plane offset
- 4. Column offset

## 7.6.1 Angle Offset

This mode is useful when it is difficult to set up the prism directly, for example at the centre of a tree. Place the prism at the same horizontal distance from the instrument as that of point A0 to measure .To measure the Coordinate of the centre position, operate the offset measurement after setting the instrument height/prism height.

- •When measuring coordinates of ground point A1: Set the instrument height/prism height.
- •When measuring coordinates of ground point A0: Set the instrument height only. (Set the prism height to 0)

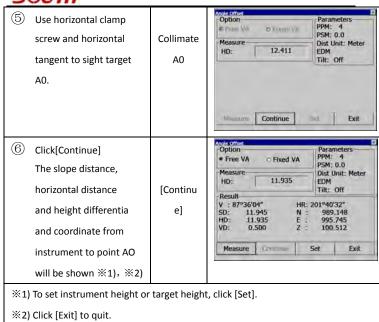

- •In the Angle Offset Measurement Mode, there are two setting methods for the vertical angle.
- 1. Free vertical angle: The vertical angle will be changed by rotating telescope.
- 2. Hold vertical angle: The vertical angle will be locked and never changed by rotating telescope.

When sighting to AO, you can select one way, [Hold] is to fix vertical angle to the prism position. When you select [Free], SD (Slope Distance) and VD (Vertical Distance) will be changed according to the movement of telescope.

(	OPERATIONAL STEPS	KEY		DISPLA	Υ
1)	Click[Offset].	[Offset]	VA(V): HA(HR): North (N): East (E): Zenith(Z): Mode Setup	87°36'03" 212°00'10" 989.628 993.522 100.536 Angle C	EDM Mode:Fine[S] Tilt: Off  V Angle & Dist  Offset to Offset Offset offset

Dist. Offset.		East (E): 995,997  Zenith(Z): 100 512  Mode Occ Distance Offset Setup Store Plane Offset Plane Offset Plane Offset

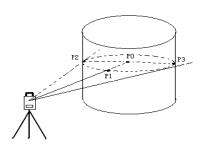

## 7.6.3Column Offset

If it is possible to measure circumscription point (P1) of column directly, the distance to the center of the column (P0), coordinate and direction angle can be calculated by measured circumscription points (P2) and (P3).

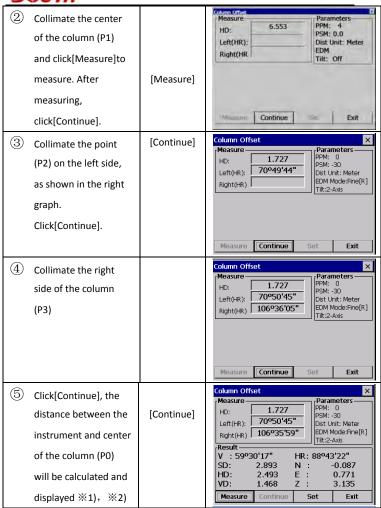

The direction angle of the center of the column is 1/2 of total direction angle of circumscription points (P2) and (P3).

 $\bullet$  Setting the coordinate of occupied point , refer to "6.3.1 Setting Coordinate Values of Occupied Point ".

OPERATIONAL STEPS	KEY			DISPLA	Y
In Offset dialog box,     click [Column     Offset]to enter into     Column Offset     measurement.	[Column Offset]	VA(V): HA(HR): North (N): East (E): Zenith(Z): Mode Setup	91°2 200° 98 99	26'49" 7.686 5.490 6.74 Angle Off Distance Column 0 Plane Off	Offset of Para,

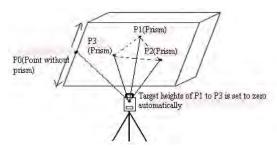

- ※1) To set instrument height or target height, click [Set].
- ※2) Click [Exit] to quit.

### 7.6.4 Plane Offset

Measurement will be taken for the place where direct measuring can not be done. For example distance or coordinate measuring for an edge of a plane.

Three random target points (P1, P2, P3) on a plane will be measured at first in the Plane Offset measurement to determine the measured plane. Collimate the target point (P0) then the instrument calculates and displays coordinate and distance value of cross point between collimation axis and of the plane.

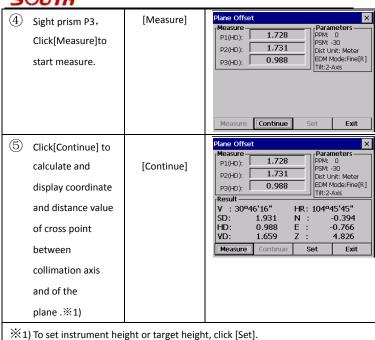

• Setting the coordinate of occupied point, refer to "6.3.1 Setting Coordinate Values of Occupied Point".

ОР	ERATIONAL STEPS	KEY	DISPLAY
1	In Offset dialog box, click [Plane Offset]to enter into Plane Offset measurement.	[Plane Offset]	VA(V):   49°39'35"   Parameters   PPW: 0   PSM: -30   PSM: -30

## 8. START STANDARD SURVEYINGPROGRAM

In Total station main menu, click"Std Survey"to enter standard surveying program. The screen displays as follows:

#### Multiple Job Files

Standard Surveying program uses different files (with Job name) for raw data, coordinates and character strings. The job is given alphanumeric names. You may have many jobs

in the system. You may create a new job for storing data, or you may open an existing job for data storage. You are also allowed to delete job files.

## •Traverse & Topographic Recording Sequences

Backsight and front sight observation options allow user to record traverses or sets of multiple observations in any sequence. Multiple observations of front-sights and backsights are averaged dynamically.

A side shot option allows data collection for topographic surveys. Traverse and topographic collection may be combined.

#### Offsets

A single offset option is activated by a function key and allows manual entry of perpendicular offsets, or calculated offsets, including remote elevation from a second angle reading.

#### Point Coordinate and String Generation

Coordinates are generated in real-time with optional storage. Stored coordinates are recalled at occupied stations and used for back bearing calculation.

#### Horizontal Circle Setting

Backsight bearing may be set on the instrument from calculated coordinates or manual input.

#### Control point Coordinate Library

Every control point library is accessible by all jobs for storage of frequently used coordinates. Control point file may be entered manually, or uploaded from computer.

#### Point Code Library

Point codes may be selected from the library file.

#### • Edit and Delete Data

Raw data, point coordinates, control point coordinates and codes may be edited and deleted in the total station.

#### Download to Serial Port

Raw data, coordinates can be sent to a computer by using a serial cable.

#### •Upload Point Code from Serial Port

The point code of total station may be created by uploading codes from a computer.

### •Upload Roads Design data from serial port

Horizontal alignment data, vertical alignment data and cross section data for Alignment lay out can be uploaded from serial port.

#### Point Setting-Out

The standard settingout program calculates bearing and distance, displays offsets from occupied point to lay-out point after each measurement. Coordinates of set-out points can be saved and differences downloaded in the fill-cut files.

Note that the scale factor defined under the SETUP will be used in the calculation of setting out distances.

#### Strings Setting Out

Setting out of points by string (point code) allows the setting out of points on a line created in design software.

#### Road Setting Out

Two options allow the setting out of points by chainage and offset from a road

alignment. Refer to Road Alignment.

#### Traverse Adjustment

The Bowditch adjustment method is used to adjust a recorded traverse. The traverse is defined by entering start and end points and the intermediate points are determined from foresight observations.

#### Resection

Calculate coordinates by known points. The method of calculation is depending on the data available. Either two points with angles and distances, or three points with angles only are required. Where more than three points and up to maximum of 10 points are available the least squares method is used.

Note that the scale factor defined under the SETUP function will be used is the calculation.

#### Occupied Point ElevateCalculation

Calculate the occupied point by single observation to a known point.

#### Intersections

Coordinates calculate from two known points, with either bearings or distances.

#### Inverse

Calculate the bearing and distance between 2 known points, Note that the scale factor defined under the MENU function will be used in the calculation of distances

#### Area Calculation

Calculate the area of points by Pcode.

#### Radiation

Coordinates of a point can be computed by entering bearing and distance.

#### Missing Line measurement

The slope distance, horizontal distance and vertical distance between two points can be computed.

#### Batter boards

It sets out the construct area of building. If two points cannot be setout, a batter board can be placed in the vicinity. The intersection point of the line connecting two setout points and the batter board can be found.

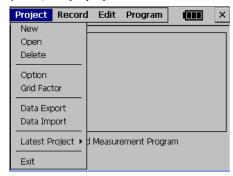

#### Tape Dimension

Tape dimension is a program which integrates surveying using a total station and a measuring tape. This program is especially useful when a quick survey of an object is required.

## 9. PROJECT

In standard survey menu, click [Project].

This menu allows following functions be performed:

- (1) Create, open, delete job file
- (2)Setting job option
- (3)Set grid factor
- (4)Data export/import

Standard measuring program require that every time measuring you must create a job file name, if not, system will create a default file name (default) automatically. All the measuring results will be saved in this file.

### 9.1 CREATE NEW PROJECT

Create a new project file. A job name has a maximum of 15 characters and should be made up from the letters A-Z,

numbers 0-9 and the minus sign (\_# \$ @ % + -), but the first character cannot be a

## space.

	OPERATION STEPS	KEY	DISPLAY
1)	In [Project] menu, click [New].	[New]	Project  Informa Projecta  Project   Project
2	In the prompt dialog box, enter name of project, operator, and brief information.  After inputting one item, use stylus to click the next item.   1)	Enter information	Project Informa Project a: Meas Dat Operator Coord Da Brief Fixed Dat Occ Pt: BS Pt: SS Pt: FS Pt: Create
3	Inputting all, click [Create] to save. The new created project is defaulted as current project. The system return to standard survey main menu. ※ 2), ※3)	[Create]	Project Record Edit Program  Information— Project:ash.npj Meas Data: 0 Coord Data: 0 Fixed Data: 0 Occ Pt: BS Pt: SS Pt: FS Pt: Standard Measurement Program

X1) Project: All the measurement data will be stored in this file.

Operator: Operator's name (Can be default).

Brief: Brief information of the project. (Can be default)

Other: The operator can enter other information, such as instrument model.( Can be default)

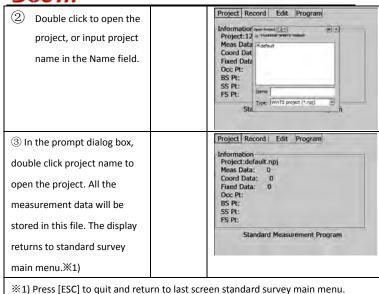

※2) Press [ESC] key to exit the screen without saving the settings.

\*3) If the project exists, the system prompts "Project are the same!" So, select OPEN option to see a list of current jobs before creating the new job if you are not sure which jobs currently exist.

## 9.20PEN PROJECT

### 9.4 PROJECT OPTION

OPE	RATIONAL STEPS	KEY	DISPLAY
1	In [Project] menu, click[Option](or press [▲]/[▼] to select), the screens as the right graph.	[Option]	Project  Informati Project Options    Fixed File   Project Options   X
2	Click each item to set. Click [Set] to return.	[Set]	Project Record Edit Program X  Information Project:default.npj Meas Data: 0 Coord Data: 0 Fixed Data: 0 Occ Pt: BS Pt: SS Pt: FS Pt: Standard Measurement Program

#### Options:

Fixed File: Set the fixed point [On] or [Off].

If it is set as [On], when the fixed point file will be scanned for coordinates before prompting for the coordinates. When the same point number is saved in coordinate database or fixed database. The data in [coordinate data] will be called up.

2) If the station file option is OFF, the fixed point file is not searched.

<u>Coord. Display</u>: Set whether to display coordinate of NEZ during measurement.

Coord. Transform: Set whether to calculate and save coordinate.

If set as [On], when the measuring mode is H/V/SD or H/HD/VD, the coordinates will be calculated and saved automatically.

2) If set as [Off], the calculated coordinate will not be saved.

[Note]: In adjusting traverse, to save coordinate or set the calculated bearing angle into instrument, this option should be set to ON.

Layout Save: The setting of storing layout point coordinates, when the coordinates are saved, each layout point with designed coordinates and layout coordinates and cut or fill

height will be listed.

\*\*Note that System Setting apply to all jobs, when it is changed, all jobs will be affected.

#### 9.5 GRID FACTOR

Measured horizontal distance is multiplied by the scale factor in coordinate calculation. The raw data is not altered by the scale factor. Enter the scale factor and the mean elevation into screen, the downloaded raw data will contain a scale factor record. The following grid factor is used to calculate coordinates.

Calculation Formula:

1. HEIGHT FACTOR= 
$$\frac{R}{R + ELEV}$$

R : The average radius of the earth

ELEV: The height of the mean sea level

#### SCALE FACTOR

Scale factor: the scale on the measurement station

GRID FACTOR

Grid factor = height factor × scale factor

Distance Calculation

1. GRID DISTANCE

 $HDg = HD \times Grid factor$ 

HDg: Grid distance

HD: Ground distance

2. GROUND DISTANCE

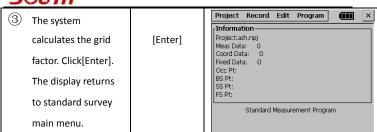

HDg

 $HD = \overline{Grid}$ 

Enter the scale factor and elevation.

OPERATIONAL STEPS	KEY	DISPLAY
<ol> <li>In [Project] menu, click [Grid Factor](or press [▲]/[▼] to select), the screen displays as the right graph.</li> </ol>	[Grid Factor]	Project Record Edit Program   X     X
② Input the Scale and Elevation.		Project Record Edit Program   X

Note:1. Inputting range of scale:0.990000  $\sim$  1.010000. The default value: 1.00000

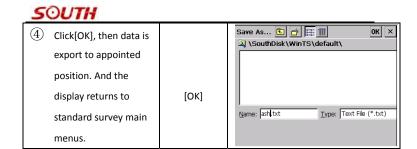

2. Inputting range of average altitude: -9999~9999The default value: 0

## 10. DATA EXPORT/IMPORT 10.1DATA EXPORT

Measuring data coordinate and data of dig/fill, cross section may be exported to specified location.

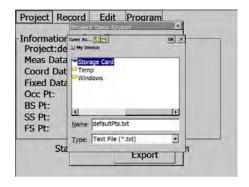

OPERATIONAL STEPS	KEY	DISPLAY
In project menu,     click[Data Export].	[Data Export]	Per New Irr Open Delete Option Grid Factur Data Export Data Import Latest Project Exit Measurement Program
2 In the prompt dialog, click the data you want to export. Click[Export].	[Export]	Project Record Edit Program  Resistation Fronce:  Information Project: Personal Profession Project: Personal Profession P
3 Select the place to save export data Input file name in the Name field.		Project Record Edit Program  Information

#### SD CARD STORAGE:

N7/N9 allow surveyors to restore data into SD card.

Export the data you need to the disk inside of the total station first. System will save the result in TXT form.Plug in the SD card, and then you could find that icon of SD card in N7 /N9 system.Copy the file you need to SD card and disconnect it from total station.

#### SOFTWARE EXPORT

Export the project you need to the disk inside of the total station first. System will save the result in TXT form. Then connect the N7/N9 total station to computer with

the USB cable after checking that if there Windows Mobile Device Center software has already been installed. Windows Mobile Device Center will show as follow:

At same time this icon will appear in your My computer.

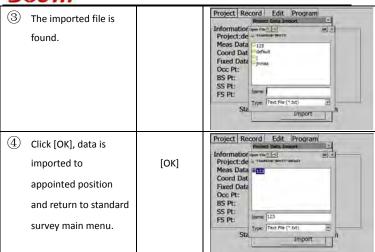

Now you should find the TXT form file in Mobile Device and copy them to your PC disk. The process is completed.

### **10.2 DATA IMPORT**

Coordinate files for setout, fixed point and code library files, alignments and cross section files for setout may be uploaded from a computer to the total station, then import to the project.

OPERATION STEPS	KEY	DISPLAY
In Project menu, click     [Data Import].	[Data Import]	Project Record Edit Program X  New Open Delete Option Grid Factor Data Export Data Import  Latest Project    ### Measurement Program  Exit
② Select the data type you need to import, and click [Import]. ※ 1)	[Import]	Project Record Edit Brooram  Information Project: defa Meas Data: Coord Data: Fixed Data: Occ Pt: BS Pt: SS Pt: FS Pt: SS Pt: FS Pt: Import  X

※1)HZ Alignment: Upload a horizontal alignment for road design layout. Data format please refer to appendix A. There is only one start point can be existed in a block of horizontal alignment data; otherwise it may cause some mistakes.

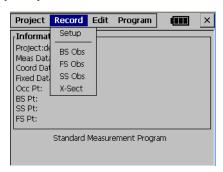

VT Alignment: Upload a vertical alignment for road alignment layout. Data format is described in Appendix A.

X-Sect Data: upload a design cross section file for road design layout: The uploaded cross sections cannot be edited nor downloaded. Data format is described in Appendix A.

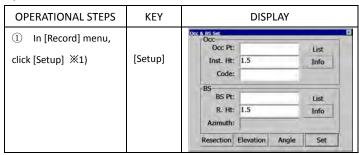

### 11. RECORD MEASUREMENT DATA

The RECORD menu is mainly used for collecting and recording raw data. It allows setting occupied point and backsight bearing, start backsight observation, foresight observation; sideshot observation and cross section observation. In standard survey main menu, click [Record]

# 11.1 SETTING OCCUPIED POINT AND BACKSIGHT POINT

②In "Occ PT" input the point name. Click [Info].

A: The system will start searching function. If the point name doesn't exist in internal memory, system will prompt to input coordinate As shown in the right graph.

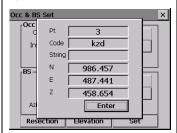

B: If the point name exists in internal memory, system will call up the point automatically and display on the screen.

**%Note:** If the point exists both in the coordinate data library and fixed data library, then data from coordinatedata library will be used.

Details see "11.1.1Resection" and "11.1.2Elevation of Occupied Point"

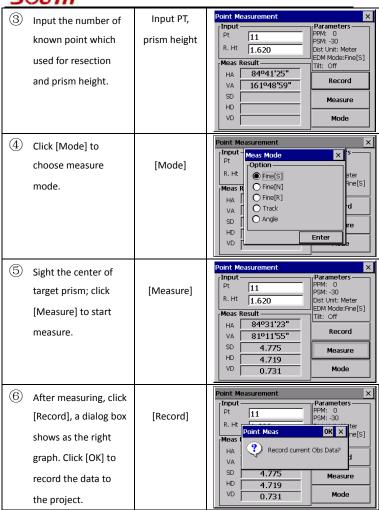

### 11.1.1Resection

If the coordinates of an occupied point are unknown, a resection can be performed to calculate these coordinates. A resection involves the measurements from an occupied point to several other known points. It is possible to perform a resection by measuring angles and distances or by measuring angles only. The type of measurements influences the minimum number of observations needed to perform a resection. In case of angle as well as distance measurements a minimum of 2 observations are required, by measuring angles only a minimum of 3 observations should be performed.

3001H		
OPERATIONAL STEPS	KEY	DISPLAY
In [Occ. & BS Set] menu input occupied point name, click [Resection]. If the point name doesn't exist in internal memory, system will prompt to input coordinate after saving the data, click	[Resection]	Occ & BS Set X  Occ Coord Edit X  Inst. Code
[Resection].		Add Delete Para. Coord Enter
② Click [Add] to add a new resection measurement. As shown in the right graph.	[Add]	Point Measurement

Resection The system returns to dHA 11 resection main menu. The screen displays the PT just 1 Þ measured If the scale: coordinate is Delete Para. Coord Enter unknown, system will request user to input the coordinates and then return to resection main menu. Resection 8 Click [Add] again, dVA repeat steps  $2\sim6$ [Add] 0.0000 0.0000 -7.2604 to finish measuring and recording other F resection points. \*\*1) e1: -433.717 scale: Delete Coord Enter Add Para.

In case 3 angle measurements or 2 angle and distance measurements have been performed, the coordinates of the occupied point can be displayed by pressing [Coord]. Click [Enter].※2)

Resection dHA dVA 0.0000 North 1897.529 East 5344.035 Zenith [ 893.400 Enter F e1: -433.717 Coord Add Delete Para. Enter

※1) On the lower side of the screen discrepancies (e1) or the standard deviation in N, E, Z direction (sN, sE, sZ) of the occupied point will be displayed. Discrepancies will be shown in case two distance measurements have been performed. They are calculated using the following equations.

[Coord]

e1 = HD12 (Calculated using measurements) – HD12 (Calculated using known coordinates)

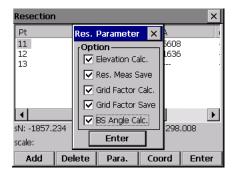

HD12 denotes the horizontal distance between the first and second point.

※2) If the distance of more than three points or angles of more than four points have been measured; the standard deviation will be displayed instead of discrepancies. The number of residuals shown depends on the parameters selected. Generally, the worst observation will have the largest residual. This observation can be deleted by placing the bar on this observation using the arrow key and then press [DEL]. The observation is removed from the list. The coordinates of the occupied point, its standard deviation or discrepancies and the residuals of the remaining observations are automatically recomputed.

By clicking [Para.], the parameters which are calculated during resection can be

selected. The following screen will be shown.

- •It is possible to select whether the level of the occupied point, a scale factor or the backsight bearing ('Calculate Bkb') should be calculated. Furthermore it is possible to select whether the calculated scale or the measurements which have been performed ('Store res meas') should be stored.
- After setting, click [Enter] to return to the main resection screen, saving the changed mode and (re)calculation of the occupied point, residuals and the required parameters.

Press [ENT] in the resection main menu will quit this function and save the coordinates of the occupied point. In case 'Store res meas' was turned on in [PARAM], the measurements which have been performed and which are shown in the box will be saved as well.

In case 'Calculate Bkb' in [PARAM] was turned on, the backsight bearing will be calculated and set by pressing [ENT] key and leaving the main resection screen.

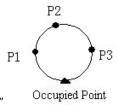

The calculation will use all measurements which are shown in the box. In order to calculate a backsight bearing of high quality:

The residuals of the horizontal angle should have low values.

The user shouldn't change the horizontal angle when leaving the main resection screen.

#### NOTE:

- 1) The measurements can be performed in any order. The point numbers shown in the box in the main resection screen will be sorted by horizontal angle.
- 2) When 3 points are used for resection using angle measurement only, you must

consider the "danger circle."

E.g.:

- 1) If p1, p2, p3 and OccPt fall on the circle, the result can not be computed.
- 2) If the point is near the circle then the result is unstable.
- 3) Residuals are useful to avoid that observations of low quality will be used for the resection calculation. However, in case of a small number of observations or a bad geometrical constellation of the points it is possible that one bad observation influences several residuals.
- 4) The unit of residuals is similar to the unit of the measurements performed. However the residuals of horizontal angle and vertical angle are always displayed in decimals. E.g.: 3°49′ 50″ shows as 3.4950

- 5) The message 'Occupied point coordinate is not computed ' is shown if the calculated scale is not within  $0.9\sim1.1$ .
- 6) More than one measurement to the same point can be performed during resection. In that case the character '\*' is placed behind the point number. The average of the measurements to same point is used for the calculations.
- 7) The following table shows which residuals will be shown.

 $\Delta H$ : The residual of horizontal angle.  $\Delta V$ : The residual of vertical angle  $\Delta SD$ : The residual of slope distance.

NOTE: The residuals which will be shown depend on the measuring mode and whether elevation is calculated.

Calc. Elevation: ON	Calc. Elevation : OF	F
Meas Mode : H/V/SD	ΔH, ΔV, ΔSD	ΔН
Meas Mode : H/V	$\begin{vmatrix} & & & & & & & & & & & & & & & & & & &$	

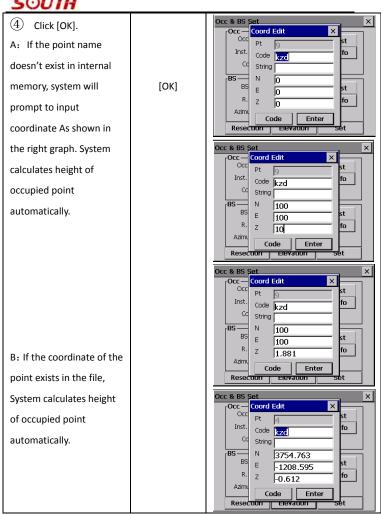

### 11.1.2 Elevation of Occupied Point

If the elevation of a point to be occupied is not known but a point of known elevation can be observed, then the station elevation can be computed.

### **FUNCTION KEY**

In [SSObs], click [Function], the function menu prompts.

### 11.4.1 Offset

Apply the following procedure to a point which can not be measured directly. Measured data change to raw data directly.

A radial (forward) offset is along the line of sight, with positive away from the instrument, and a tangential (right) offset is perpendicular to the line of sight

with positive to the right, as viewed from the instrument. A vertical offset is positive upwards.

•Offsets may be entered manually if measured by tape, or calculated by measuring a second angle to the required point.

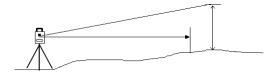

A tangential offset may be calculated by recording a second angle to intersect with the perpendicular offset from the

current observation. This method can be used to obtain an approximate position for the center of an object, for example a tree. Take a shot to the side of the object. When the offset screen has been selected, sight the center of the object, and press [Horizon] to read the horizontal angle. A perpendicular offset from the original line of sight will be calculated and entered to the screen.

To calculate a vertical offset (remote elevation), make an observation to an accessible point above or below the point required. When in the offset screen, sight the point required, and press [Vertical]. The vertical angle will be used to calculate the difference in elevation from the ground to the point above or below. The offset will be written to the screen. Make the current target height has been entered into the point code screen before selecting [Offset].

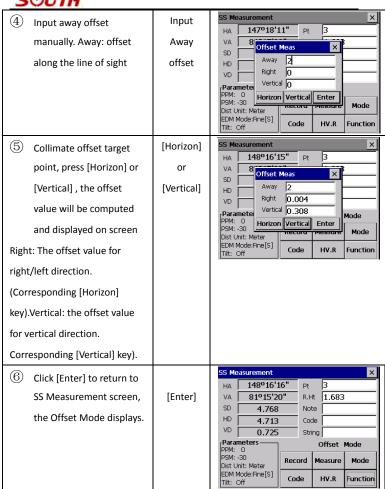

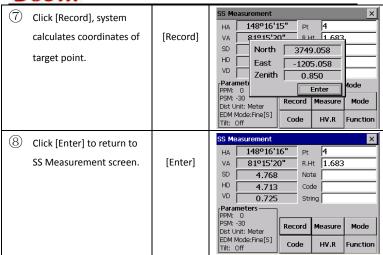

Record an observation as close as possible to the required point.

	OPERATIONAL STEPS	KEY	DISPLAY
1	In [SS] measurement, sight the prism center. Click [Measure] to start measure.	Measure	SS Measurement
2	Keep the instrument still, click [Function].  A dialog box prompts as the right graph.	Function	SS Measurement
3	In Function menu, click [Offset] to enter Offset measurement.	[Offset]	SS Measurement

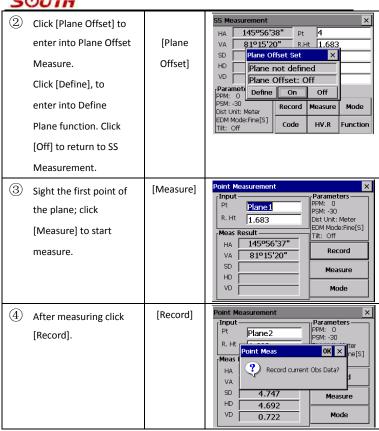

### 11.4.2 Plane Offset

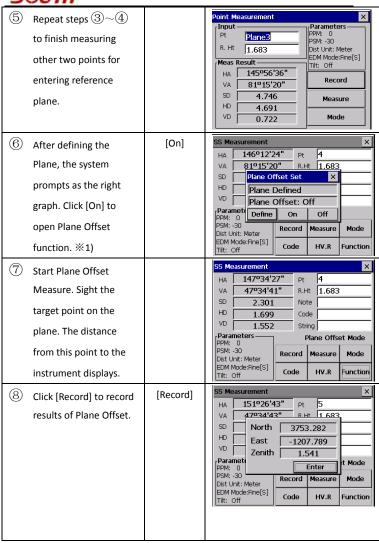

This mode is similar with  $\texttt{\PROGRAM} \, \texttt{PROGRAM} \, \to \, \texttt{\POffset} \, \texttt{Plane Offset} \, \texttt{I}$  .

OPERATIONAL STEPS	KEY	DISPLAY
In SS Measurement,     click [Function].	[Function]	SS Measurement   X

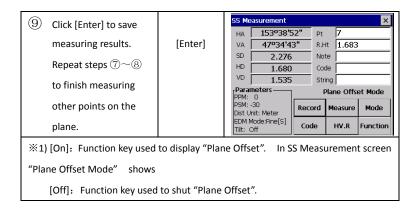

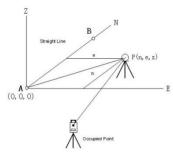

# 11.4.3 Pt. Line Mode (For Measurement from Point to Line)

This mode is used for coordinate measurement of target points P which treats A (0,0,0) as the origin and line AB as the N axis. See below:

A: reference point 1

B: reference point 2

After measuring coordinates of point A, B, enter Point & Line Measurement
 139

Mode. Set A, B as reference point 1, 2. Set once again a coordinate system which has A as origin and line AB as N axis. Start measurement again. (Never change information of occupied point during the process.)

	OPERATION STEPS	KEY	DISPLAY
1	Measure coordinates of Point A、B,record in the memory. In SS Measurement, click [Pt. Line Mode] to enter into Point Line Mode.	[Pt. Line Mode]	SS Measurement
2	Define base line. Enter the Point number of start point and stop point If the point does not exist, it displays "Coord PT not found!" Press [Enter]. # 12.5 FILL/ CUT DATA

The fill-cut data generated by the layout option can be viewed by the [EDIT]→ [Fill-Cut Data] option. The display shows the coordinates saved during setout, and the difference to the uploaded coordinate. As shown in the graph below:

- •This function can realize search for the fill-cut data.
- •Fill-cut data can not be edited.

# 13. PROGRAM MENU

The menu includes below functions:

- (1) Set Out
- (2) Roads
- (3)Cogo
- (4) Traverse
- (5)B.Boards
- (6) Tape Dim

#### **13.1 SET OUT**

To show the SET OUT menu, from the 【Program】 menu, select 【Set Out】. The setting out option allows setting out by point number, strings, alignments and cross sections.

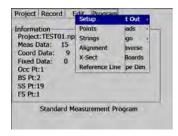

- •The basic routine for setting out is similar in all these methods, except for the way data is uploaded and the setup sequence.
- •Setting out points allows setting out by point number in point number order. Setting out strings allows setting out by string or point code in the order in which the points were uploaded within the string. Setting out of alignment and cross sections, points are specified by chainage and offset with reference to an uploaded alignment.

# 13.1.1Occupied Point&Backsight Point

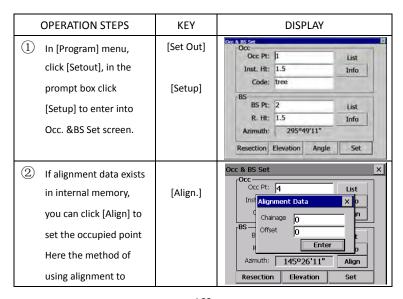

In [Program] menu, click [Set Out]→[Setup], in the prompt menu click [Set] to enter into Occ.&BS Set dialog box. The setting procedure is similar to those in [RECORD] menu.

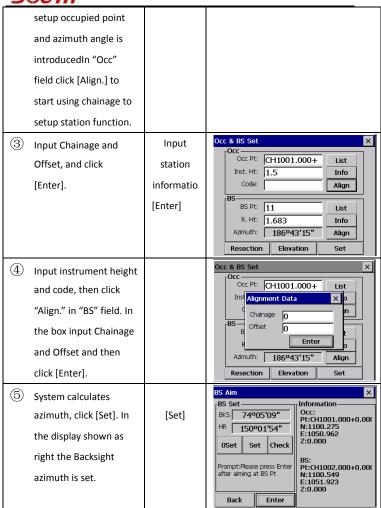

•If alignment data exists, the occupied point screen changes to include chainage and offset:

•Here the method of using alignment to set occupied point and backsight point will be introduced.

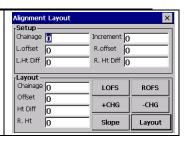

6 The occupied point and backsight azimuth is saved, and then the alignment setout data screen displays.

• If you already have entered the occupied point and backsight point details from either RECORD or SETOUT menus, you can skip these routines and go directly to the set out POINTS, STRINGS, ALIGN or X-SECTS.

### 13.1.2 Point Set Out

After setting occupied point and backsight point, you can start point setting out Example:

OPERATIONAL STEPS	KEY	DISPLAY
In [Program] menu,     click [Set Out], in the     prompt box click     [Points].	[Set Out] [Point]	Project Record Edit Program  Informatic Setup Set Out Project:defa Points Roads Cogo Points Strings Cogo Data: Alignment Fixed Data: X-Sect Occ Pt:CH100-X-10000 SS Pt:8 FS Pt:2 Standard Measurement Program

In the prompt dialog
box input the PT and
Prism Height.

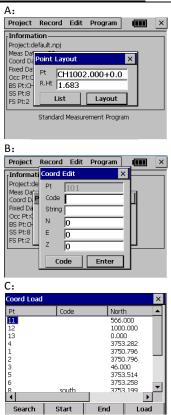

A:
If the coordinates of the
point number exists in
memory, system will call
up the point automatically.

B:
If the coordinate data of
the point is not stored in
memory, system will
recommends that to input

C:

setout point.

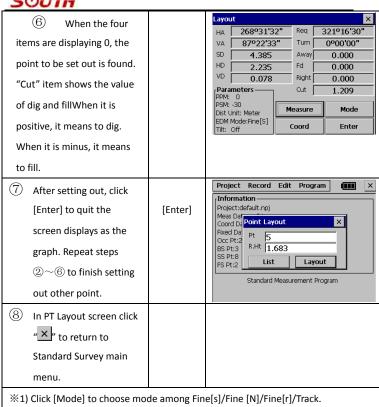

The point to be set out can be presaved in the project, then click [List] to call up.

	9011 <del>1</del>		
3	After setting the set out point, click [Set Out] to start setting out. Sight the prism center; click [Measure] to start measure. $\%1$ )	[Set Out] [Measure ]	Layout
4	Rotate the telescope, making "Turn" item and "→" item display as 0, and ask the rodman to move the prism.		Layout
(5)	Sight the prism center, and click [Measure] to start measure. Ask the rod man to move prism frontward and backward. Making "Away" item and "个" item displays as 0.	Measure	Req   321°16'30"     VA   87°22'33"   Turn   0°00'00"     SD   1.699   Away   -0.001     HD   1.697   Fd   -0.001     VD   0.078   Right   0.000     Parameter   PPM: 0   PSM: -30     Dist Unit: Meter   EDM Mode:Fine[S]   Tit: Off   Coord   Enter

## Explanation:

**Req:** The angle required from occupied point to set-out point.

**Turn:** The angle that should rotated. When it is 0, means the bearing angle is correct.

**Away:** The distance required from prism to set-out point. Positive sign indicates that prism should move far from instrument. Negative sign indicates that prism should move towards instrument. The value means the distance to be moved.

**Fd** : The distance along the line of sight to the instrument and is positive away from the instrument. Positive sign means the point is in front of sight line; Positive sign means the point is behind sightline.

**Right**—: It is perpendicular to the line of sight with positive to the right when facing the instrument. Positive sign means the point is in the right side of sight line; Positive sign means the point is in the left side of sightline.

**Cut:** The elevate difference to the point. Positive sign indicates that this point is higher than calculated value and it should be cut. Negative sign indicates that it should be filled. The value is the fill-cut data value.

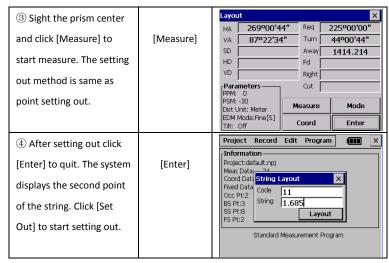

•Anytime you click "X" on the upper right screen to return to Pt No screen, you can input a new point and set out next point. Or click [List] to call up data stored in internal memory. If the point is new, system will recommends you to input its coordinate.

# 13.1.3String Setout

After setting occupied point and backsight point, you can start string setting out Example:

OPERATIONAL STEPS	KEY	DISPLAY
①In [Program] menu, click [Set Out], in the prompt menu click [Strings]	[Set Out] [Strings]	Project Record Edit Program   X
	[Set Out]	Project Record Edit Program X  Information Project/default.npj Meas Datar Accord Data String Layout Fixed Data Occ Pt:2 BS Pt:3 SS Pt:8 FS Pt:2  Standard Measurement Program

[Note]: A fixed point data file can not be used in String Setout.

## 13.1.4Reference line

This program facilitates stake-out or checking lines for buildings, sections of road, simple excavations, etc.

### What Reference Line is:

A reference line can be defined as a known base line. The

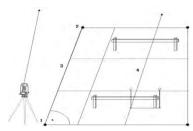

reference line can be offset longitudinally, in parallel or vertically to the base line, or be rotated around the first base point as required.

### **Definition of Base Line:**

The base line is fixed by 2 base points that can be defined in 3 ways:

- Measured points
- Enter coordinates using keypad
- · Select point from memory

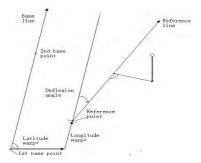

In the picture:

- 1. 1st base point
- 2. 2nd base point
- 3. Baseline
- 4. Reference line

In the process of using base line, the base line can be offset longitudinally, parallel and vertically or rotated. This new line is called the reference line. All measured data refers to the reference line.

Offset: Parallel offset of the reference line to the right, referred to the direction of the base line.

Line: Longitudinal offset of the start point (=reference point) of the reference line in the direction of base point.

HZ: Height offset; the reference line is higher than the selected reference height.

Rotate: Rotation of the reference line clockwise around the reference point.

#### The meaning of soft keys under the screen of Ref.Line Define:

[F1]([NewBL]): Return to Ref.Line Define screen to re-define base line.

[F2]([MEAS]): The offset value of point to be measured related to the reference line.

[F3]([STAKE]): Activate the Orthogonal Stake Out.

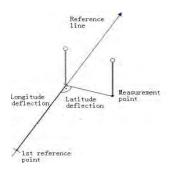

[F4]([OSET]): Set all offset values/rotate to zero.

For any of the known points and measurement points, this procedure can also compute the offset of longitude and latitude of these points relevant to reference line.

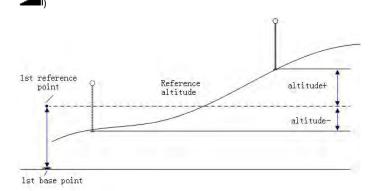

#### "Line & Offset" Sub-application

The Line & Offset' sub-application calculates from measurements or coordinate longitudinal, parallel offsets, and height differences of target point relative to reference line.

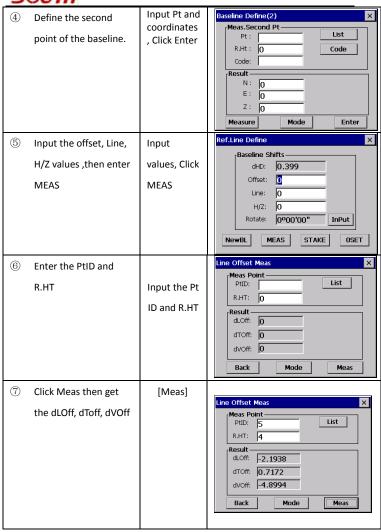

Always calculates the height difference with the height of the first reference point (  $\!\Delta$ 

_	SOUTH				
	OPERATIONAL STEPS	OPERATION	DISPLAY		
1	In Programs menu, press [Set Out] to enter "Reference line".	Click "Reference line"	Project Record Edit Program X  Inform Project Roads Set Out South		
2	Set the station and orientation, (As the method of setting job, station and orientation have been introduced previously; it will not be repeated here.)		Occ & BS Set		
3	There are three methods to define the baseline points, measure directly and call the point from List, and input the coordinates directly.	Input Pt and coordinates	Baseline Define(1)		

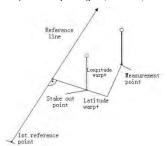

## **Orthogonal Stake-Out**

User can enter longitudinal, transverse and height offsets for the target points to be set-out related to the reference line. The program calculates the difference between a measured point and the calculated point. The program displays the orthogonal (pLine, pOffset, p  $\longrightarrow$  ) and the polar (pHz, $\triangle$   $\longrightarrow$  ) differences.

## 13.2 ROAD DESIGN AND LAYOUT

## 13.2.1 Define Horizontal Alignment

In [Roads] menu, select[Define HZ AL]. To know how to calculate an alignment, see appendix B.

•Horizontal alignment consisted of following elements: start point, straight line, circular curve and transition curve. First define the start point.

3 After inputting information of start point; click [Save] to save. Then enter into the screen of alignment input process. As shown on the right.

Oefine HZ AL
State
No. 2 Chainage 0.000
Define Bearing 0°00′00″

Straight
Arc
TRNS
PT
Load
Save

The "Define HZ AL" displays current chainage and the bearing angle (the tangent line from the chainage) and the function key (For creating new line). System provides four functions: defining straight line, circular curve, transition curve, point. Select a function key, enter the detailed information of the chainage, the alignment elements will be created. Click [Save], the new chainage and bearing angle will be calculated automatically and the main alignment screen will be restored. Now other line style can be defined. Press ESC to exit current screen. To modify the element which entered in advance, you should enter the "Edit Alignment" option, the new elements can be added only in the end of the original alignment file.

[Save]

#### Straight line

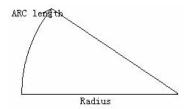

When the start point or other line style is well-defined, it allows you to define straight line. A straight line consists of bearing angle and distance; the distance value can not be minus.

	OUTH	r	
	OPERATIONAL STEPS	KEY	DISPLAY
1	On the screen of input process, click [Straight], the screen will display factors of straight line to be defined.	[Straight]	Define HZ AL   X
2	Input the bearing and length of the straight line.	Input bearing and distance.	State
3	Click [Save] and display the chainage of the end of the line and its bearing. You can define other arcs. When the straight line is in the midst of the lignment, the bearing of the straight line is calculated on the base of previous factors. You can input a new bearing manually.	[Save]	Define HZ AL  State No. 3 Chainage 48.420 Define Bearing 25°000'00"  Straight Arc TRNS PT Load Save

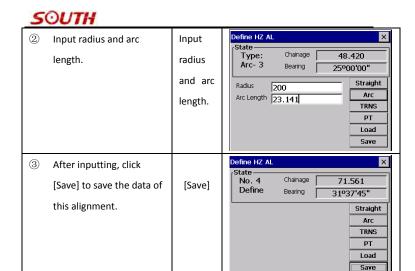

## **Circular Curve**

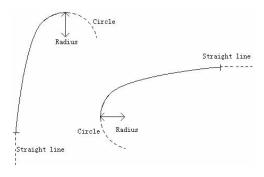

Click [ARC] in the "Define HZ AL", the circular curve can be defined. Circular curve consists of Arc length and Radius. The rule of radius value: along the forward direction of the curve. When the curve rotates to right, the radius value is positive. When the curve rotates to left, the radius value is minus. The arc length can not be minus.

OPERATIONAL STEPS	KEY	DISPLAY
On the screen of input     process, click [ARC]. The     screen will display the     factors of arc to be defined.	[ARC]	State

## **Transition curve**

Press [TRNS] key in the "Define HZ AL", the transition curve can be defined. Transition curve consists of the minimum radius and arc length. The rule of radius

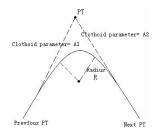

value: along the forward direction of the curve. When the curve rotates to right, the radius value is positive. When the curve rotates to left, the radius value is minus. The arc length can not be minus.

	OPERATIONAL STEPS	KEY	DISPLAY
1	On the screen of input process, click [TRNS], the screen will display factors of transition curve to be defined.	[TRNS]	Define HZ AL  State Type: Chainage 71.561 TRNS- 4 Bearing 31º37'45"  Radius 0 Arc Length 0  Straight Arc C TRNS PT Load Save
2	Input radius and arc length.	Input radius and arc length.	State
3	After inputting, click [Save] to save the data of this alignment.	[Save]	State

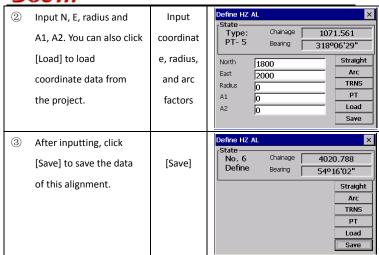

#### PT (Point)

In "Define HZ AL" menu Click [PT], the point can be defined. A point element consists of coordinates, radius and transition curve parameter A1 and A2. Radius, A1 and A2 can not be minus. If radius is entered, an arc is inserted with the specified radius. If transition curve parameter A1 or A2 is entered, a transition curve with the specified length is inserted between straight and arc.

OPERATIONAL STEPS	KEY	DISPLAY
On the screen of input     process, click [PT], the     screen will display     factors of point to be     defined.	[PT]	State

[NOTE]: When you want to enter A1, A2 from transition curve length L1, L2, the following equations are used:

$$A = \sqrt{L \operatorname{Radiu}}$$

$$A_2 = \sqrt{L_2 \text{ Radiu}}$$

Any changes to the alignment must be done using the edit alignment option.

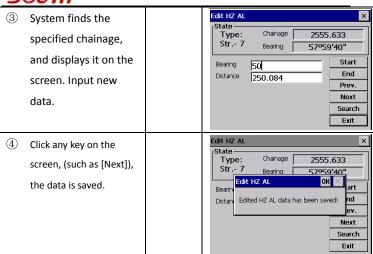

# 13.2.2Edit Horizontal Alignment

To edit the alignment select Edit HZ AL from the Roads menu.

OPERATIONAL STEPS	KEY	DISPLAY
In the menu of [Roads],     click [Edit HZ AL] to     enter into the screen of     Edit HZ AL.	[Edit HZ	Project Record Edit   Program   X
② The screen displays the last alignment data. Search for the data to be edited.※1) A: Click Prev. /Next to find the alignment data to be edited.  B: Click [Search], a dialog as	[next]	A:    State

## 13.2.4Edit Vertical Alignment

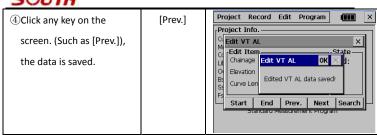

To modify vertical alignment data, the operational steps are same as editing horizontal alignment data.

## 13.2.5 Alignment Setout

After setting road data, you can start setting out

For an alignment setout a horizontal alignment must have been uploaded from computer by using [Set Out]→[Alignment].

 the vertical alignment is optional, but is required to cut and fill. The defining method is same as defining horizontal alignment.

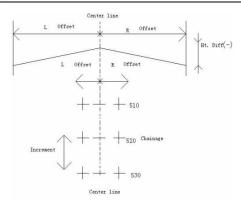

#### Rule:

Offset left: the horizontal distance from the left stake point to the center line.

Offset right: the horizontal distance from the right stake point to the center line.

Elevation difference: Left (right) is the elevation difference between left (right) stake and the center line point.

## Example:

Please set the occupied point and backsight azimuth firstly.

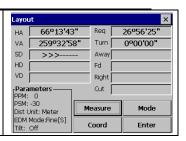

OPERATIONAL STEPS	KEY	DISPLAY
In Alignment Layout     screen, enter the start     chainage, chainage		Alignment Layout  Setup Chainage To Increment O  Loffset O Roffset O  Lift Diff O Roffset O

line.  To setout dig/fill data, the height difference is needed.		

3	OUTH		
2	After inputting, the center line setting out data of the start chainage displays on the lower screen.		Alignment Layout   X   Setup   Chainage   1001   Increment   10
	Here stipulate: first set out point on center line, and then set out points on left/right chainage. ※1) It prism height, and click Out] to set out.	[Set Out]	Layout   X
4	Sight the current prism, click [Measure] to start measure and calculate parameter difference between measuring point and setting out point.	[Me asure]	Layout   X     HA
(5)	Rotate the telescope, making "Turn" item and "→" item display as 0, and ask the rodman to move prism.		Layout   X     HA

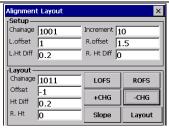

⑥ Sight the prism center, click [Measure] to start measure. Ask the rodman to move prism making "Away" and "个" display as 0.

When four items are 0, the point to be set out is found. "Cut" item indicates the dig/fill value. When it is positive, it means to dig. When it is minus, it means to fill.

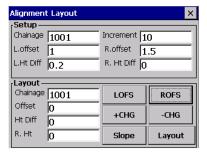

After finish setting out one point, click [Enter] to quit. The screen returns to Alignment Setout main screen. Click [LOFS]/[ROFS], or +CHG/-CHG, repeat steps 2~6 to finish setting out other points. ※1)

※1) Press [LOFS] (or [ROFS]), corresponding chainage, offset, elevation difference will be displayed on the screen. The chainage and offset can be entered manually. If the offset is minus, the offset point is at the left side to center line. If the offset is positive, the offset point is at the right side to center line.

Explanation for the main setout screen:

**LOFS:** The key is use to setting out the left side stake. Press it to display the offset and the height difference of the left side stake.

**ROFS:** The key is use to setting out the right side stake. Press it to display the offset and the height difference of the right side stake.

**+CHG:** The key is use to increasing the chainage.

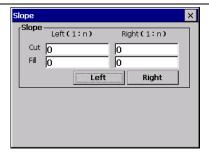

-CHG: The key is use to decreasing the chainage.

**Slope:** The key is used to slope set out.

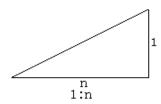

## 13.2.6 Slope Setout

Slope setting-out can be performed as part of the Alignment setout option. Only after defining vertical alignment and horizontal alignment, it is possible to perform slope setting-out. In Alignment Layout menu click [Slope] to display slope layout. Slope layout main menu:

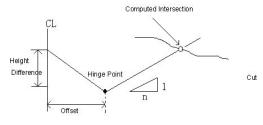

The input cut/fill value is a ratio.

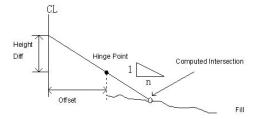

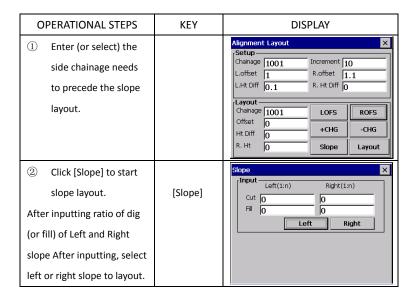

The left and right slopes may be entered for both cut and fill. Enter the required slopes using positive numbers for both cut and fill. The software selects the appropriate slope from the table depending on whether the situation is on the left or right and in excavation or fill.

Excavation or fill is determined by the estimated level at the offset of the hinge point. If the level is above the level of the hinge then the cut slope is used, otherwise the fill slope is used.

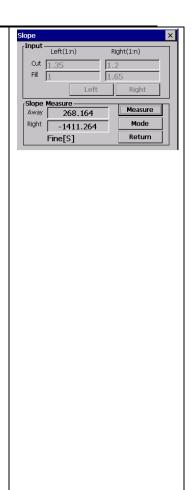

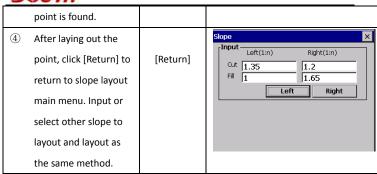

(3) Enter the slope layout menu. Input the prism pole and sight a point where it is estimated the slope to intercept and press [Measure] to take the first trial shot. The appropriate slope is selected from the data entered in the preceding step.The first intercept is assuming a horizontal surface at the level of the measured point. The error from measured point to calculated point will display. The layout method of slope is same with point setting out. When the data which display in  $[\rightarrow]$  and  $[\uparrow]$ is 0, the setting out

[Measur

el

#### [Note]:

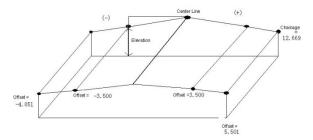

- 1) An intersection can not be computed if the ground surface passes through the hinge point.
- 2) The cut is not displayed because the cut at the computed point is zero.

## 13.2.7Cross Section Setout

To set out design cross sections select X-Sect from the Set Out menu.

The cross section setout is similar to the alignment setout, the points are uploaded in chainage, offset and level format and a reference alignment must also exist.

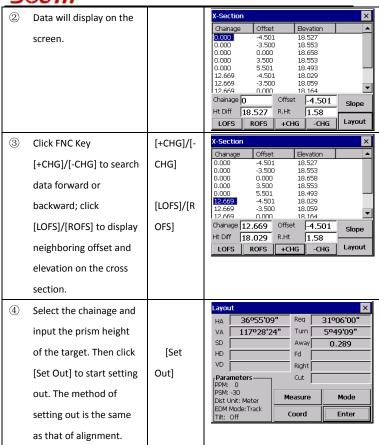

#### X-Sects layout main menu

The screen displays cross section data imported to total station. About the method please refer to "10.2 DATA IMPORT". Example:

OPERATIONAL STEPS	KEY	DISPLAY
In the menu of Set Out,     click [X-Sect].		Project Record Edit   Program

%The HeightDifference value is elevation value here. (Different to Horizontal Alignment Setting out)

[Note]: Cross Section data can not be entered nor edited by manual input; it has to be copied into WIN total station.

#### OPERATIONAL STEPS:

- Create a new text file (.txt) on the computer and save it. See Appendix A for the format of cross section data.
- Copy the file to total station.
   In the total station, import the saved data to current project by "Data Import".
   See "10.2 Data Import".
- 3) You can use [LOFS]/[ROFS] to display appointed chainage. The sequence of the displayed data is according to the sequence in text file. Enter data in the order of its offset values (from left to right), if chainages are the same.
- 4) When editing the cross section data, chainages should be in the order from little to much.

#### 13.3 COGO

The COGO menu contains a number of coordinate geometry functions. (Fixed point data can not be used in these functions).

Intersection

4-points intersections

Inverse

Area

Radiation

Missing line Measurement

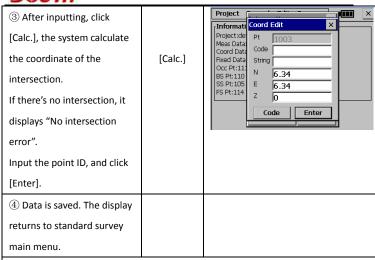

## 13.3.1Intersection

The coordinate for a point can be computed by the intersection of two known bearings.

SOUTH		
OPERATIONAL STEPS	KEY	DISPLAY
① In [Program] menu, click [Cogo]. And click [Intersection] in Cogo menu.	[Cogo] [Intersectio n]	Project Record Edit Prog Set Out Information Project:TESTO1, Intersection go Meas Data: 19 Coord Data: 5 Fixed Data: 10 Occ Pt:1 BS Pt:2 BS Pt:19 Radiate FS Pt:1 Volume  Standard Measurement Program

# **13.4 TRAVERSE ADJUSTMENT**

The Bowditch (compass rule) adjustment method is used to adjust a recorded traverse. The traverse is defined by entering start and end points and the intermediate points are determined from foresight observations. The coordinates for the start and end points must be known.

- If the coordinates of the initial BKS PT are known, the software calculates the bearing from the point data.
- •The foresight option must be used to record observations to the traverse points and the observed end point must have a different point number to the known point.

•To adjust angles the end point must be occupied and a known point observed to measure the closing angle. The point number used for this observation must be different from the known point too.

Start Pt: 111 BKS Pt: 110 End Pt: 116 Close Pt: 117

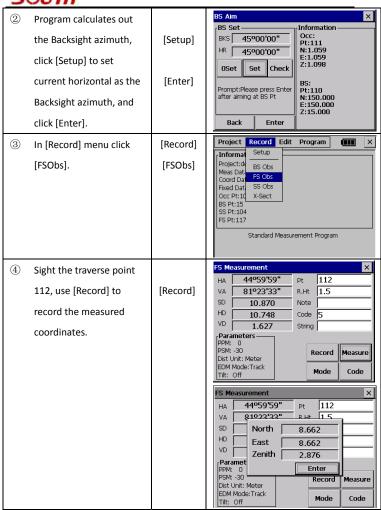

Known Pt: 110 111 916 917

Example:

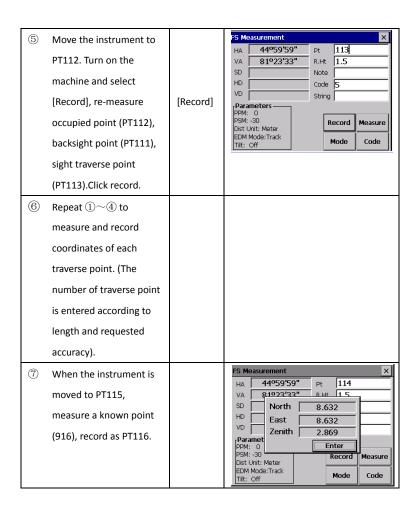

## 1. Measurement

# **13.5 BATTER BOARDS**

When setting out points, particularly for building plots, it is usually necessary to mark a point with an offset so that the point can be re-established after work has been carried out in the work area. In this case batter board can be used: the intersection point (of a batter board and the line that connects

two points that have to be set out) can be marked. Later, the intersection points are used by pulling a string line between these points. In this way, the required points can be reconstructed.

•There are two ways to proceed:

First way is using two sides of the batterboard. The user is advised to use this method in case high accuracy is required, control of the measurements is required or one batterboard is used to mark more than one intersection point. Refer to Chapter 13.5.1.

Second way is using one side of the batterboard. The user is advised to use this method in case a guick method is required. Refer to Chapter 13.5.2.

# 13.5.1Method 1: Batter board using two sides

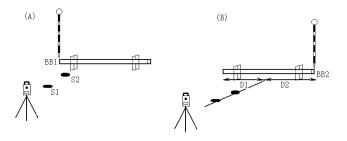

The two sides of batterboard should be measured now. Put the reflector above one side of the batterboard, enter a number for this point (BB point 2) and press Enter.

## Operating Procedure:

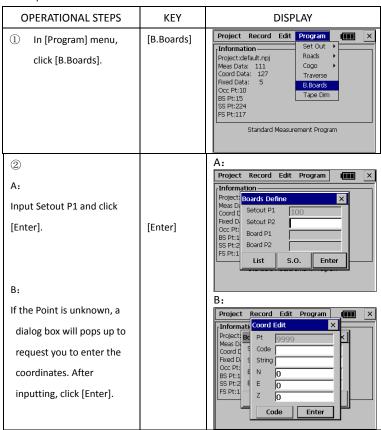

Two setout point (S1 and S2) are selected and one side of the batterboard is measured (BB1).

The other side of the batterboard is measured (BB2). The intersection point of the batterboard and the line connecting S1 and S2 is calculated. Next, the distance (D1) from BB1 to

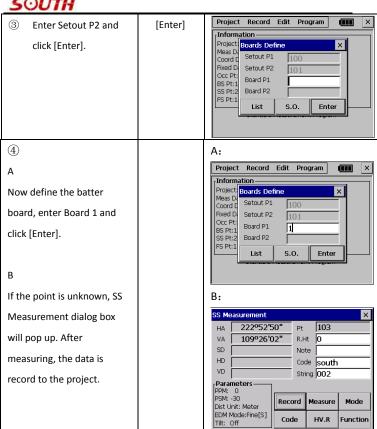

intersection point and the distance (D2) from BB2 to intersection point are calculated.

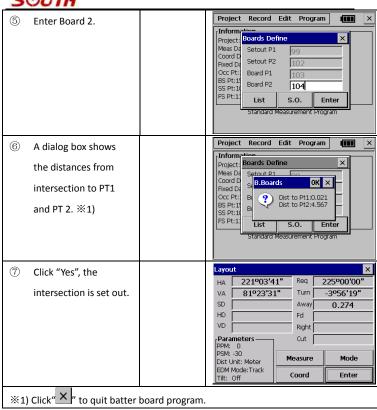

★The setout of this intersection point is identical to Point Setout, which is discussed in paragraph 13.1.3, except for two differences.

Automatically the intersection point is chosen for setting out.

CUT is not shown at the screen.

#### NOTE:

If the intersection point is not on the batterboard, the message "Point Not on Batterboard!" is shown on the screen.

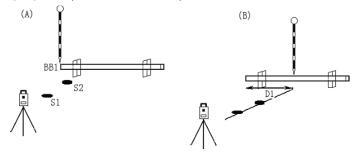

In case a batterboard is used twice and its position hasn't changed, it is not necessary to re-measure the sides of the batterboard. Use the same number for the sides of the batterboard.

The error message "Invalid value! "is shown if the batterboard and the line connecting the two setout points are parallel.

The coordinates of the calculated intersection point are recorded in the coordinate file. The number of this intersection point is, compared to the highest existing number, incremented by one.

# 13.5.2Method 2: Batterboards using one side

Click [S.O.] in case you want to measure only one side of the batterboards.

## Operating procedure:

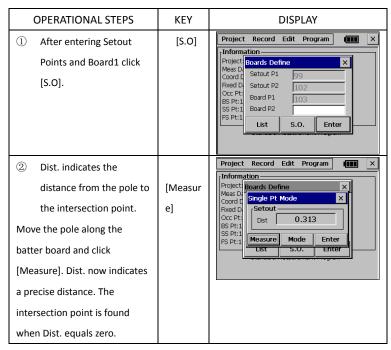

Two setout points (S1 and S2) are selected and one side of the batterboard is measured (BB 1). An approximate distance D1 is shown.

The position of the pole is changed according to the value of D1 and a

measurement is performed. The distance D1 is now precise. The process has to be repeated until D equals zero to find the intersection point.

## Example:

#### NOTF +

After the first side of the Batter board has been measured and [S.O.] has been selected, it is assumed that the orientation of the batter board is perpendicular to the line connecting the two setout points. The distance D1 is calculated using this assumption. Next a second point on the batter board is measured. From now on the distance D1 will be calculated using the correct orientation of the

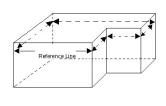

batterboard.D1 will now be more precise.

The error message 'Invalid value 'is shown if the batter board and the line connecting the two setout points are parallel.

The coordinates of the calculated intersection point are recorded in the coordinate file. The number of this intersection point is, compared to the highest existing number, incremented buy one.

## 13.6 TAPE DIMENSIONS

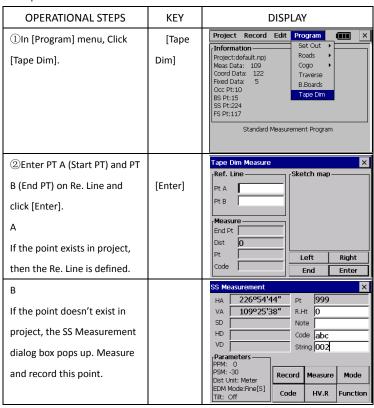

Tape dim is a program which integrates surveying using a total station and a measuring tape. This program is especially useful when a quick survey of an object is required. It is assumed that all angles of this object are rectangular.

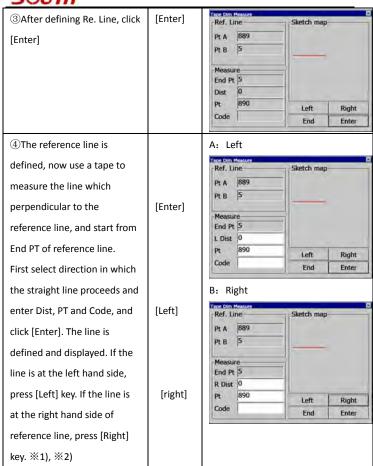

Measure an object by TAPE DIM. Two corners of the object are measured using the total station and a reference line is defined. Next the other sides of the object are measured using a measuring tape. When the last side is measured, the closing error will be shown.

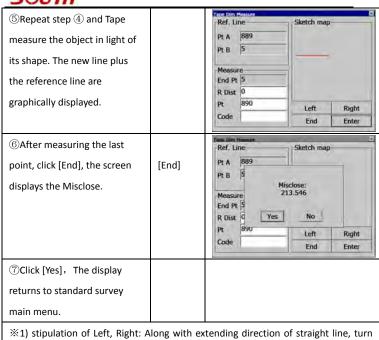

There are two ways to return to the main menu:

left is Left.  $\times$ 2)Inputting range of Dist: 0.001 $\sim$ 1000

- 1) Press [ESC] key in case you have measured an open polygon. All points defined are automatically stored.
- 2) Click [End] to quit in case you have measured a closed polygon. The closing error (the distance between the last point and the first reference point) will be displayed. Click [OK] key to store all points defined and to return to main menu.

**NOTE:** The reference line and the lines defined by offsets are graphically shown only in case at least one offset has been entered.

# **14. SYSTEM SETTINGS**

## 1, UNIT SETTING OPTIONS

Menu	Selecting Item	Contents
1. Ang. Unit	deg/gon/mil	Select degree (360°) , gon(400 G) or mil

		refraction and earth curvature. Selections
		for the refraction coefficient are :
		OFF( No Correction ) , K =0.14 or K =0.20

#### Correction for atmosphere refraction and the earth curvature

The instrument will automatically correct the effect of atmosphere refraction and the earth curvature when calculating the horizontal distance and the height differences.

The correction for atmosphere refraction and the earth curvature are done by the formulas as follows:

Corrected Horizontal Distance: D=S \* [ $\cos\alpha$ +  $\sin\alpha$ \* S \*  $\cos\alpha$  (K-2) / 2Re] Corrected Height Differentia: H= S \* [ $\sin\alpha$  +  $\cos\alpha$ \* S \*  $\cos\alpha$  (1-K) / 2Re]

If the correction of atmosphere refraction and the earth curvature is neglected, the calculation formula of horizontal distance and the height differentia are:

D=S·cosαH=S·sinα

n formula:	K=0.14Atmo	osphere Refraction Modulus
Re=6370 km	The Earth Curvature	? Radius

## 15. CHECK AND ADJUSTMENT

This instrument has undergone a strict process of checking and adjustment, which ensures that it meets quality requirement. However, after long periods of transport or under a changing environment, there may be some influences on the internal structure. Therefore, before the instrument is used for the first time, or before precise surveys, user should launch check and adjustment introduced in this chapter to ensure the precision of the job.

## 15.1 PLATE VIAL

#### Check

Please refer to Chapter 3.2 "Leveling by Using Plate Vial"

#### Adjust

- 1. Adjust leveling screws, make plate bubble centered;
- 2. Rotate the instrument 180°; watch the offset of plate level;
- 3. Tweak adjustment screws (on the right of the plate vial) with the correction pin to make plate bubble to move half of the offset back;
- 4. Rotate the instrument 180°, check adjustment result;
- 5. Repeat the above steps until the plate level is centered in all directions.

## 15.2 CIRCULAR VIAL

#### Check:

No adjustment is required if the bubble of circular vial is in the center after checking and adjustment of the plate vial.

#### Adjust

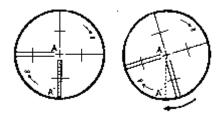

- 1. Adjust circular bubble after plate bubble is centered.
- 2. Loosen the screw (one or two) opposite with bubble deflective direction;
- 3. Tighten the screw on the direction accordant deflective until circular bubble is centered;
- 4. Adjust three adjustment screws for several times until circular bubble is centered;
- 5. The force power fixing three adjustment screws must be consistent when circular level is centered at last.

## 15.3 INCLINATION OF RETICLE

#### Check:

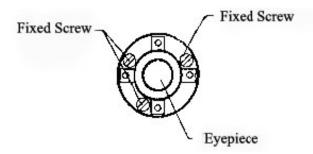

- 1. Sight object A through the telescope and lock the horizontal and vertical clamp screws.
- 2. Move object A to the edge of the field of view with the vertical tangent screw (point  $\mathbf{A}'$ )
- 3. Adjustment is not necessary if object A moves along the vertical line of the reticle and point A' still in the vertical line. As illustrated, A' offsets from the center to the cross hair tilts, then need to adjust the reticle.

## Adjust

- 1. If the object A does not move along with the vertical line, firstly remove the eyepiece cover to expose the three or four reticle adjusting screws.
- Loosen all the reticle adjusting screws uniformly with an adjusting pin. Rotate the reticle around the sight line and align the vertical line of the reticle with pointA'.
- 3. Tighten the reticle adjusting screws uniformly. Repeat the inspection and adjustment to see if the adjustment is correct.
- 4. Replace the eyepiece cover.

# 15.4 PERPENDICULARITY BETWEEN LINE OF SIGHT AND HORIZONTAL AXIS (2C)

#### Check

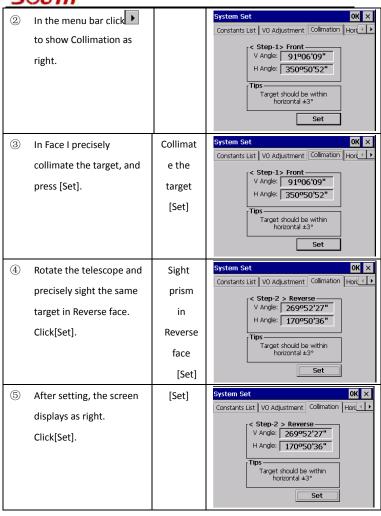

- 1. Set object A at about 100 meters away the same height as the instrument, and make the vertical angle with  $\pm 3^\circ$ . Then level and center the instrument and turn on the power
- 2. Sight object A in Facel and read the horizontal angle value. (e.g.: Horizontal angle L=10°13 $^{\prime}$  10 $^{\prime\prime}$  ).
- 3. Loosen the vertical and horizontal clamp screws and rotate the telescope. Sight object A in Reverse faceand read the horizontal angle value. (e.g.: Horizontal angle R=  $190^{\circ}13'-40''$ ).
- 4.  $2 \text{ C} = \text{L-R} \pm 180^{\circ} = -30'' \ge \pm 2''$ , adjustment is necessary.

## Adjust

A. Electronic Adjustment Operation Steps:

OPERATIONAL STEPS	KEY	DISPLAY
After leveling the instrument, in the main menu click[System Setup].		System Set  OK X  Unit Set   Measurement Set   Atmospheric Parame          Inalige Unit         Distance Unit       Meter   Feet   US-Feet      Temperature Unit       mmHg   hPa   inHg      Save

Houst-0 000

Set

- B. Optics Adjustment(professional maintenance man only)
- 1. Use the tangent screw to adjust the horizontal angle to the right reading which has been eliminated C, R+C=190°13 $^{\prime}$  40 $^{\prime\prime}$  -15 $^{\prime\prime}$  =190°13 $^{\prime}$  25 $^{\prime\prime}$
- Take off the cover of the reticle between the eyepiece and focusing screw. Adjust the left and right adjusting screws by loosening one and tightening the other. Move the reticle to sight object A exactly.
- 3. Repeat inspection and adjustment until  $\mid 2$  C  $\mid < 2$  0 ".
- 4. Replace the cover of the reticle.

Note: After adjustment, need to check the photoelectricitycoaxiality.

# 15.5 VERTICAL INDEX DIFFERENCE COMPENSATION

#### Check

- Mount and level the instrument and make the telescope parallel with the line connecting the center of the instrument to any one of the screws. Lock the horizontal clamp screw.
- 2. After turning on the power, zero the vertical index. Lock the vertical clamp screw and the instrument should display the vertical angle value.
- 3. Rotate the vertical clamp screw slowly in either direction about 10mm in circumference, and the error message "b" will appear. The vertical axis inclination has exceeded 3 ´ at this time and exceeds the designated compensation range.
- 4. Rotate the above screw to its original position, and the instrument display screen will show the vertical angle again, meaning that the vertical index difference compensation function is working.

#### Adjust

If the compensation function is not working, send the instrument back to the factory for repair.

# 15.6 ADJUSTMENT OF VERTICAL INDEX DIFFERENCE (I ANGLE) AND SETTING VERTICAL INDEX 0

Inspect the item after finishing the inspection and adjustment of items in 15.3 and 15.5.

#### Check

- 1. Power on after leveling the instrument. Collimate object A in Face I and read the Vertical angle value L.
  - 2. Rotate the telescope. Sight object A in Face  $\, \mathrm{II} \,$  and read the Vertical angle

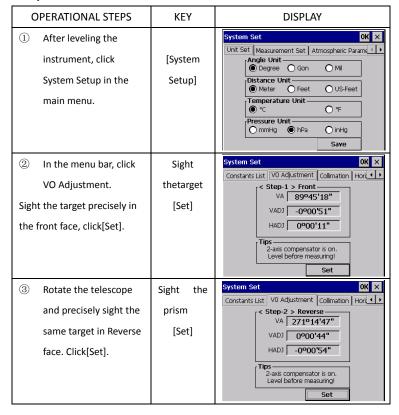

value R.

3. If the vertical angle is 0°in zenith, I=(L+R-360°)/2

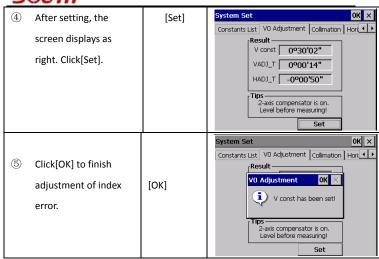

If the vertical angle is0°in zenith, I=(L+R-180°)/2 or(L+R-540°)/2

4. If  $|i| \ge 10''$  should set the Vertical Angle 0 Datum again.

#### Adjust:

#### Note:

- 1. Repeat the checking steps to measure the Index Error (i angle). If the Index Error cannot meet the requirement; user should check whether the three steps of the adjustment and the collimation are right. Then set again according to the requirement.
- 2. If Index Error still not meets the requirement after the repeated operation, the instrument should be returned to factory for inspection and repair.
- 3. The vertical angle displayed in zero point setting hasn't been compensated or modified, only for reference during setting.

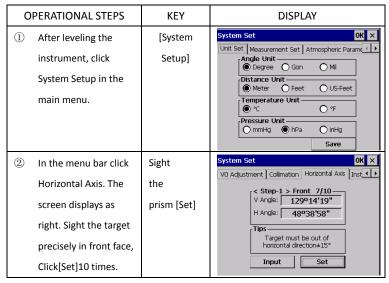

# 15.7 HORIZONTAL AXIS ERROR COMPENSATION ADJUSTMENT

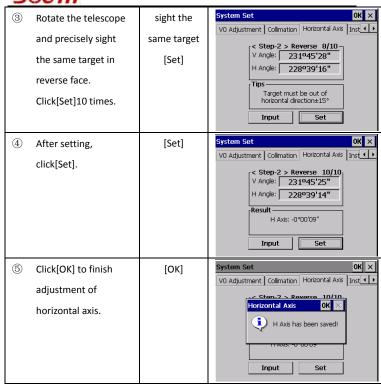

As the horizontal axis error only affects the angle of sight, it can be only confirmed through observing the target the height of which is obviously lower or higher than the instrument.

To avoid the influence of sight axis, user must have an associated adjustment before adjusting sight axis.

It is unnecessary to collimate the prism or the target plane to ascertain the transverse axis error. Therefore user is enabled to launch this adjustment at any time. Select a recognizable point which is rather far away from the instrument, and much higher or lower than the instrument. Make sure it can be precisely collimated twice.

# **15.8 OPTICAL PLUMMET**

#### Check

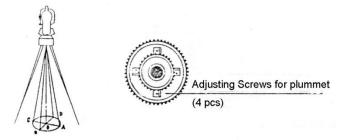

- 1. Set the instrument on the tripod and place a piece of white paper with two crisscross lines on it right below the instrument.
- 2. Adjust the focus of the optical plummet and move the paper so that the intersection point of the lines on the paper comes to the center of the field of

view.

- 3. Adjust the leveling screws so that the center mark of the optical plummet coincides with the intersection point of the cross on the paper.
- 4. Rotate the instrument around the vertical axis, and observe whether the center mark position coincides with the intersection point of the cross at every 90°.
- 5. If the center mark always coincides with intersection point, no adjustment is necessary.

Otherwise, the following adjustment is required.

#### Adjust

- 1. Take off the protective cover between the optical plummet eyepiece and focusing knob.
- 2. Fix the paper. Rotate the instrument and mark the point of the center of optical plummet which falls on the paper at every  $90^{\circ}$ . As illustrated: Point A, B, C, and D.
- 3. Draw lines that attach AC and BD and mark the intersection point of the two lines as O.
- 4. Adjust the four adjusting screws of the optical plummet with an adjusting pin until the center mark coincides with Point O.
- 5. Repeat the inspection and adjusting steps to make the instrument meets the requirements.

6. Replace the protective cover.

# 15.9 INSTRUMENT CONSTANT (K)

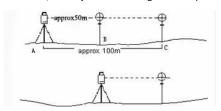

Instrument constant has been checked up and adjusted in the factory, K=0. It seldom changes and it is suggested to check one or two times every year. The inspection should be made on the base line, also can be made according to the following method.

·Check

- 1. Mount and level the instrument on Point A at a plain field. Use the vertical hair to mark Point B and Point C with the distance of 50m on the same line, and set the reflector accurately.
- 2. After setting temperature and air pressure, measure the horizontal distance of AB and AC accurately.
- 3. Set the instrument on Point B and center it accurately, measure the Horizontal Distance of BC accurately.
- 4. Then the Instrument Constant can be obtained:

$$K = AC - (AB + BC)$$

K should be near to 0, If  $\mid$  K  $\mid$  >5mm, the instrument should be strictly inspected in the standard baseline site, and adjusted according to the inspection value.

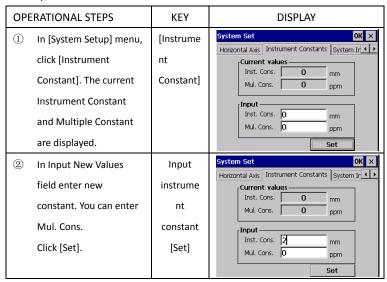

Adjust

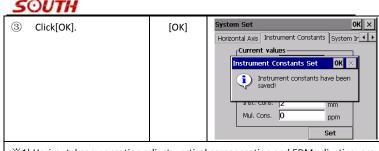

If a strict inspection proves that the Instrument Constant K has changed and is not close to 0. If the operator wants to adjust, should set Stadia Constant according to the Constant K

- 1. Set the orientation via the Vertical Hair to maintain Point A, B, C on the same line precisely. There must be a fixed and clear centering mark on the ground of Point B
- 2. Whether the prism center of Point B coincides with the Instrument Center is a significant step to inspect the accuracy. So on Point B the tripod or compatible tribrach should be used. It will decrease the difference.

·Input Instrument Constant:

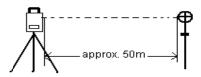

%1) Horizontal compensation adjust, vertical compensation and EDM adjusting: are set by the factory, please do not make any setting.

# 15.10 PARALLELISM BETWEEN LINE OF SIGHT AND EMITTING AXIS

#### Check:

- 1. Set the reflector 50m away from the instrument.
- 2. Collimate the center of the reflector prism with telescope reticle.
- 3. Switch on the instrument, and enter into Distance Measurement Mode. Press

[DIST] (or [All]) to measure. Rotate the Horizontal Tangent Screw and Vertical Tangent Screw to launch electric collimation and make the light path of EDM unblocked. In the bright zone find the center of emitting photoelectric axis.

4. Check the center of reticle to coincide with the center of emitting photoelectric axis. If so, the instrument is proved eligible.

Adjustment:

If the center of reticle deviates from the center of emitting photoelectric axis, user should sent the instrument to professional repair department.

#### 15.11 TRIBRACH LEVELING SCREW

If the leveling screw appears flexible, adjust the two adjusting screw in the leveling screw to tighten the screw appropriately.

#### 15.12RELATED PARTS FOR REFLECTOR

#### 1 The Tribrach and Adapter for Reflector

The plate vial and optical plummet in the adapter and tribrach should be checked.

Refer to Chapter 15.1 and 15.8 for more information.

#### 2 Perpendicularity of the prism pole

As illustrated in Chapter 15.8, mark '+' on Point C, place the tine of the prism pole on the Point C and do not move during the inspection. Place the two feet tine of Bipod on the cross lines of Point E and F. Adjust the two legs "e' and "f" to make the bubble on the prism pole centered.

Set and level the instrument on Point A near the cross. Sight thetine of Point C with the center of reticle, and fix the Horizontal Clamp Screw. Rotate the telescope upward to make D near the horizontal hair. Flex the prism pole Leg "e" to make the D in the center of reticle. Then both Point C and D are on the central line of reticle.

Set the instrument on Point B to another cross lines. With the same way to flex the Leg "f" to make Point C and D on the

#### central line.

Through the adjustment of the instrument on Point A and B, prism pole has been perpendicular. If the bubble offsets from the center, adjust the three screws under circular vial to make the bubble centered.

Check and adjust again until the bubble is in the center of the vial from both directions of the prism pole.

RESOBS Point number, Target height, observation times

#### 1.2 Coordinate Data Format

Point number, E, N, H, code

111,1.059,1.059,1.298,,

112,1.000,1.000,2.596,,

113,1.059,1.059,1.297,,

114,1.059,1.059,1.297,,

115,1.059,1.059,1.297,,

Additionally, the coordinate format of point to line program is:

PT, E, N, Height, code, string, start reference PT, end reference PT

3,29.145,31.367,100.632,PT,1,2

4,128.365,56.367,115.732,PT,1,2

110,29.364,31.526,100.904,PT,101,103

111,49.892,3.958,112.834,PT,101,103

#### 2. IMPORT DATA TO TOTAL STATION

Data can be imported includes coordinate data, fixed point data, code data, horizontal alignment data, vertical alignment data and cross section data. Create a new text file(.txt) on the computer, after editing and saving the data, use U disk or

synchronizing software (use Windows Mobile Device Center to synchronize total station and PC.) to copy to the total station, and use "Data Import to import to current project.

Data editing formats are displayed as follows.

## 2.1 Coordinate Data/Fixed Point Data Format

You should edit the coordinate data format on the computer as follows:

Point number, E, N, Z, code 1,1000.000,1000.000,1000.000,STN 2,990.000,1010.000,100.000,STN

101,994.890,1000.964,100.113,STN

102,993.936,1007.799,100.800,STN 103,998.515,1009.639,100.426,STN 104,1002.068,1002.568,100.342,STN 1001,1004.729,997.649,100.1153,PT 1002,1003.702,990.838,100.799,PT 1003,7911.990,990.358,100.403,PT

1004,997.311,998.236,100.354,PT

#### 2.2 Cross Section Data Format

Cross section data format editing on the computer is as follows:

Chainage, Offset, Height[, code]

0.000,-4.501,18.527

0.000,-3.500,18.553

0.000,0.000,18.658,CL01

0.000,3.500,18.553

0.000,5.501,18.493

12.669,-4.501,18.029

12.669,-3.500,18.059

12.669,-0.000,18.164,CL01

12.669,3.500,18.059

12.669,5.501,17.999

# 2.3 Point P Coding Format

The code files enclosed in code library, should assure that every line has a code, which includes entity number and layer name, etc. Every entity is ended by carriage return.

The edited coding format is as follows:

#### Code[, Entity[, Layer]]

TREE,1,VEG

FENCE,2,BDY

CL,2,CL

EP,2,ROAD

GUTTER,2,ROAD

PATH,2,PATH

DRAIN, 2, DRAIN

BM,1,CONTROL

MH,1,DRAIN

GUS,1,UTILITY

WATER,2,UTILITY

**SOUTH** 

LP,1,UTILITY

LIGHTS,1,UTILITY

ROCK,2,NS

•When there is no definition in code library, the default value for entity is "1", and

for layer is "0".

2.4 Horizontal Line

The horizontal line is transmitted from computer to instrument through line

element, including initial definition. It should be included in initial definition the

number of the start stake and coordinate of this point. The line elements include

point, straight, arc, and transition curve.

Each recorded format is:

KEYWORD nnn,nnn[,nnn]

Here:

START POINT stake number, E, N

STRAIGHT azimuth, distance

ARC radius, arc length

SPIRAL radius, length

PT E, N[, A1, A2]

(A1, A2: LENGTH)

Example 1:

START 1000.000,01050.000,1100.000

264

STRAIGHT 25.0000,48.420

SPIRAL 20.000,20.000

ARC 20.000,23.141

SPIRAL 20.000,20.000

STRAIGHT 148.300,54.679

Example 2:

START 1000.000,1050.000,1100.000

PT 1750.000,1300.000,100.000,80.800

PT 1400.000,1750.000,200

PT 1800.000,2000.000

#### 2.5 Vertical Curve

Input vertical curve data from computer through typical point and stake number, the vertical curve data should include the height, curve length, and the curve length of start point and terminal point is zero.

Data format is:

Stake number, height, length

1000.000,50.000,0.000

1300.000,70.000,300.000

1800.000,70.000,300.000

2300.000,90.000,0.000

# **[APPENDIX-B]** CALCULATE ROAD ALIGNMENT

The road alignment stake-out program can stake out the alignment elements including straight, arc and transition curve.

#### NOTE:

- •Road alignment data can be uploaded from computer or can be entered manually. Transect data can only be uploaded from computer.
- •Road alignment and transect data is managed by chainage.
- •One job corresponds to one road alignment, you can use several jobs to create several alignments.

#### 1. ROAD ALIGNMENT ELEMENTS

There are two ways to enter the alignment elements:

Download from PC.

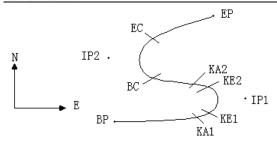

Enter into WinCE(R) series in manual.

How to enter the alignment data is explained below:

Alignment Element	Parameter	
Straight	Bearing, Distance	
Transition Curve	Radius, Length of Transition Curve	
Arc	Radius, Length of Arc	
PT	N, E, radius, A1, A2	

NOTE: When downloading from computer or selecting PT option, you do not have to calculate the Parameter.

Pt	North	East	Radius	Transition curve A1	Transition curve A2
	(N)	(E)	(R)		
ВР	1100.000	1050.000			
IP1	1300.000	1750.000	100.00	0 80.000	80.000
IP2	1750.000	1400.000	200.00	0.000	0.000
EP	2000.000	1800.000			

# Example:

To enter the following data select DEF AL of ROADS in PROG menu:

Press [ENT] and then click (PT) on the screen, Enter the following data:

N	1300.000
Ε	1750.000
R	100.000
A1	80.000
A2	80.000

Enter the following data in the above way:

N 1750.000

E 1400.000

R 200.000

A1 0.000

A2 0.000

N 2000.000
E 1800.000
R 0.000

A1 0.000 A2 0.000

The format of the data above transmitted to computer is as follows:

START 0.000,1050.000,1100.000 CRLF

PT 1750.000,1300.000,100.000,80.000,80.000 CRLF

PT 1400.000,1750.000,200.000,0.000,0.000 CRLF

PT 1800.000,1800.000,2000.000 CRLF

#### 2. CALCULATION ROAD ALIGNMENT ELEMENTS

 $(1) \ \ \hbox{\it Calculation of the length of transition curve}$ 

$$L_{1,2} = \frac{A_{1,2}^2}{R} L_{1,2}$$
: Length of clothoid

 $A_{1,2}$ : Parameter of clothoid

R : Radius

$$L_1 = \frac{A_1^2}{R} = \frac{80^2}{100} = 64 \text{ m}$$
  $L_2 = \frac{A_2^2}{R} = \frac{80^2}{100} = 64 \text{ m}$ 

(2) Calculation of Deflection Angle

$$\tau = \frac{L^{2}}{2 A^{2}}$$

$$\tau_{1} = \frac{64^{2}}{2 \cdot 80^{2}} = 0.32 \text{ rad} \qquad = \text{ deg} = 0.32 \frac{180}{\pi} = 18^{\circ}20' \ 06''$$

$$\tau_{1} = \tau_{2}$$

(3) Calculation of transition coordinates

$$N = A \cdot \sqrt{2\tau} \left( 1 - \frac{\tau^2}{10} + \frac{\tau^4}{216} - \frac{\tau^6}{9360} \dots \right)$$

$$E = A \cdot \sqrt{2\tau} \left( \frac{\tau}{3} - \frac{\tau^3}{42} + \frac{\tau^5}{1320} - \frac{\tau^7}{7560} \dots \right)$$

$$N = 80 \cdot \sqrt{2 \cdot 0.32} \left( 1 - \frac{(0.32)^2}{10} + \frac{(0.32)^4}{216} - \frac{(0.32)^6}{9360} \dots \right)$$

$$= 64(1 - \frac{0.01024}{10} + \frac{0.01048576}{216} - \frac{0.00107341824}{9360})$$

$$= 64(1 - 0.01024 + 0.00004855 - 0.00000011)$$

$$= 64 * 0.98981$$

=63.348

Similarly, the value of E is:

$$E = 80 \cdot \sqrt{2 \cdot 0.32} \left( \frac{0.32}{3} - \frac{(0.32)^3}{42} + \frac{(0.32)^5}{1320} - \frac{(0.32)^7}{7560} \dots \right)$$

$$= 64(0.10666667 - 0.00078019 + 0.0000025 - 0)$$

$$= 6.777$$

This example is symmetry spiral transition N1=N2, E1=E2

(4)Calculation of shift value

$$\Delta R = E - R(1 - \cos \tau)$$

$$\Delta R = 6.777 - 100(1 - \cos 18_{\circ 20' \ 06''})$$

=1.700

Symmetry spiral transition  $\Delta R_1 = \Delta R_2$ 

(5) Calculation of Spiral Transition coordinate

$$N_m = N$$
 -  $R\sin au$  =63.348-100sin18°20 $'$  06 $''$  =31.891 Symmetry spiral transition  $N_{m1} = N_{m2}$ 

(6) Calculation of Tangent Distance

$$D_1 = R \tan(\frac{LA}{2}) + \Delta R_2 \cos ec(LA) - \Delta R_1 \cot(LA) + N_{m1}$$

$$LA = +111255 / 47 / 2 \cos ec(LA) - \frac{1}{2} \cot(LA) + \frac{1}{2} \cot(LA)$$

$$LA = + 111^{\circ}55' 47''$$
,  $\cos ec = \frac{1}{\sin}$ ,  $\cot = \frac{1}{\tan}$ 

$$D_1 = 100 * tan(111°55′ 47″ / 2) +1.7(1/sin111°55′ 47″)$$

-1.7(1 / tan 111°55' 47")+31.891

=148.06015 + 1.8326 + 0.6844 +31.891

=182.468

$$D_1 = D_2$$

(7) Calculation of the coordinate KA1

$$N_{KA1} = N_{IP1} - D_1 \cdot \cos \alpha_1$$
$$E_{KA1} = E_{IP1} - D_1 \cdot \sin \alpha_1$$

Bearing from BP to IP1 =  $Q_1 = 74^{\circ}03'$  16.6"

$$N_{\rm KAl} = 1300 - 182.468 * \cos 74^{\circ}03' 16.6'' = 1249.872 \, {\rm m}$$

$$E_{K41} = 1750 - 182.468 * \sin 74^{\circ}03' 16.6'' = 1574.553 m$$

(8) Calculation of Arc Length

$$L = R(LA - \tau_1 + \tau_2)$$
=  $R(111^{\circ}55' 47'' - 2*18^{\circ}20' 06'')$ 
=  $100(75^{\circ}15' 35'' 180^{\circ})$ 
=  $131.353 \text{ m}$ 

(9) Calculation of the coordinate KA2

$$N_{KA2} = N_{IP1} - D_2 \cdot \cos \alpha_2$$

$$\overline{E_{KA2}} = E_{IP1} - D_2 \cdot \sin \alpha_2$$

Bearing from IP1 to IP2 = 
$$Q_2 = 322^{\circ}07' 30.1''$$

$$N_{KA2} = 1300 - (-182.468) * \cos 322^{\circ}07' 30.1'' = 1444.032 m$$

$$E_{KA2} = 1750 - (-182.468) * \sin 322^{\circ}07' 30.1'' = 1637.976 m$$

(10) Calculation of coordinates BC, EC which is ARC

(IP1,IP2,EP)

Arc length 
$$CL = R \cdot IA$$

$$CL=200*95°52'11''*\frac{\pi}{180^{\circ}}=334.648 \text{ m}$$

$$TL = R \cdot \tan(\frac{IA}{2}) = 200 * \tan(95^{\circ}52' \ 11'' / 2) = 221.615 \text{ m}$$

Each coordinates are computed:

$$N_{BC} = N_{IP2} - TL \cdot \cos \alpha_2$$

$$E_{BC} = E_{IP2} - TL \cdot \sin \alpha_2$$

$$N_{EC} = N_{IB2} - TL \cdot \cos \Omega_{2}$$

$$E_{EC} = E_{IP2} - TL \cdot \sin \alpha_3$$

here:

$$Q_2$$
 (Bearing from IP1 to IP2) = 322°07′ 30.1″

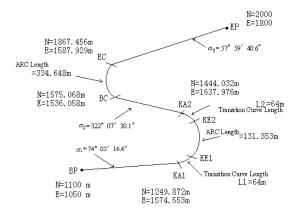

$$Q_3$$
 (Bearing from IP2 to EP) = 57°59′ 40.6″

$$N_{BC} = 1750 - 221.615 * \cos 322^{\circ}07' 30.1'' = 1575.068 \text{ m}$$

$$E_{BC} =$$
 1400 - 221.615 \* sin322°07' 30.1" =1536.058 m  $N_{EC} =$  1750 -(-221.615) \* cos57°59' 40.6" =1867.456 m  $E_{EC} =$  1400 -(-221.615) \* sin57°59' 40.6" =1587.929 m

The calculated results display as below:

The coordinates and the distance are calculated as below:

Compute the length of straight line

Straight line

BP·KA1=

$$\sqrt{(1249.872 - 1100.000)^2 + (1574.553 - 1050)^2} = 545.543$$
 m

straight line

#### KA2·BC

$$=\sqrt{(1575.068-1444.032)^2+(1536.058-1637.976)^2}=166.005 \text{ m}$$

# straight line

$$EC \cdot EP = \sqrt{(2000 - 1867.456)^2 + (1800 - 1587.929)^2} = 250.084$$
 m
